and sharp-edged, the upper with 3 notches, the hook of the lower shutting into the central one; neck short and very thick; anterior limbs twice as long as the hind ones, the former falcate, the latter the widest; tail short, compressed on the sides, and not extending beyond the shell; the color is dark brown above, with lighter spots along the ridges. It is the largest of the turtles, attaining a length of 8 feet and a weight of more than half a ton; its food consists of mollusks, crustaceans, fish, sea urchins, and marine plants; its flesh is of no value, but its shell has been used along the Mediterranean for making small boats, drinking troughs for animals, and children's bath tubs. It is found on both sides of the Atlantic, especially in the tropics, coming north as far as Massachusetts bay, and following the Gulf stream across the Atlantic to the coasts of Europe and the Mediterranean; those of E. Asia and S. Africa may perhaps be a different species; none of this genus have nails on the limbs. It was known to the ancients, and with the Greek tortoise disputes the claim of the original of Mercury's lyre, Lacépède supposing that its dried carapace and tendons were used by the Greeks in the construction of this musical instrument; the longitudinal ridges on the elongated heart-shaped back, according to Shaw, suggested the name luth or lute given to it in some countries.—The marine species have the same tenacity of life under mutilation and deprivation of food, as has been noticed in the tortoises. Turtles are found as far back as the jurassic period, continued through the cretaceous, becoming more abundant and advancing further north than at the present day, though they were not so large as the existing species; in the limited strata of the eocene clay of the island of Sheppey more species have been discovered than now exist, another proof of the higher temperature at that epoch; large species have been found in the tertiary of South Carolina and the greensand of New Jersey, of yet undetermined genera.

TURTLE DOVE, the common name of several small pigeons, especially of the genera *turtur* and *columba*, characterized by a smaller size than the domestic pigeon, weaker bill, longer toes (the inner exceeding the outer), and a longer and wedge-shaped tail; they are both arboreal and terrestrial in habit, feeding on the ground, but roosting and nesting in trees. The word turtle signified a dove until the discovery of America, when it was applied to the marine tortoises. In the genus *turtur* (Selby) the bill is slender and straight, with the tip slightly arched and acute; wings long, the 2d and 3d quills the longest; tail moderate, rounded or even; tarsi almost as long as the middle toe, for the most part naked, and the toes long and slender. There are more than a dozen species, found in various parts of Europe, India, and Africa, in woods and jungles, making their presence known by their pleasant cooing; from Europe they migrate to the south in winter; they are

generally seen in flocks of about 20, in open cultivated districts, feeding on grain, seeds of grass, &c.; the nest is made in thick woods, of small twigs loosely put together, and the eggs are two. The common European turtle dove (*T. urtica*, Selby) is 11 inches long; the head, neck, breast, and back are wood-brown tinged with pearl-gray; a patch of black feathers margined with white on each side of the neck; capulars and wing coverts black, shading into rayish, and edged with buff; lower parts white, as are the tips of the tail feathers except the two middle ones. It arrives in temperate Europe in May, leaving at the end of summer; is found also in Asia and Africa, and is only a rare visitor to Great Britain; it has been supposed to be the origin of some of the smaller partly domestic varieties which are kept only in aviaries. The collared turtle dove (*T. risoria*, Selby) is 10 inches long; the general colors are different shades of pale wood-brown, with even paler edgings, tinged with vinaceous on the under parts, and with a half collar of black on the hind neck. It is found wild in most parts of Africa, but is now widely distributed as a cage bird; many of the representations in ancient works of art, where the dove is figured as the emblem of tenderness and affection, or as the attendant of the goddess Venus, are accurate likenesses of this species, which has been kept in aviaries from remote ages. If left at liberty, it flies away, and does not seem capable of domestication like the common pigeon; in warm climates 7 or 8 broods are raised in a season; it produces a sterile progeny with the *T. urtica*. It is doubtless the turtle of the Scriptures, and is still numerous in Egypt and Asia Minor, deriving its specific name from a fancied resemblance of its cooing to a human laugh. It is so abundant at Constantinople, that it is said the Turkish government allows a certain percentage in the duty on corn on account of the quantity devoured by the turtles in its transit in open vessels to the granaries and mills.—In the genus *ana* (Selby) the bill is moderate and very slender, the wings long with the first 3 quills nearly equal and longest, and the tail of 12 feathers, very long and wedge-shaped, with the 2 middle feathers narrowed. The Cape turtle dove (*C. capensis*, Selby) is 10 inches long, of which the tail is more than one half, the closed wings reaching to about one third the length of the tail; in the male the forehead, chin, throat, and upper breast are intense black; crown, sides of neck and body, and lesser wing coverts pale French gray; middle of abdomen white; back pale brown; wings deeper brown, with a few metallic purple spots; 2 black bars on the rump; middle tail feathers grayish brown, with terminal half black, and the rest bluish gray with a broad black band near the tip; bill and feet yellow. It is seen on trees bordering the rivers of S. Africa, making its nest in low bushes.—In North America is found the Carolina turtle dove (*zenaidura carolinensis*, Bonap.), about

12½ inches long and 17½ in alar extent; the bill is weak and black; the wings pointed, with the 2d quill the longest, and the 1st and 3d nearly equal; tail longer than the wings, much graduated and wedge-shaped, and of 14 feathers; though much smaller, it resembles the passenger or wild pigeon in its lengthened tail, and was formerly ranked with it in the genus *scotopistia* (Swains.). It is bluish above mixed with light brownish olive, the former purest on the crown, wings, and upper surface of tail; the rest of head, sides of neck, and under parts generally light brownish red, purplish on breast, becoming brownish yellow behind; patch of metallic purplish on the sides of neck; sides of body and under surface of wings light blue; black spots on wings, and patch of same below ears; tail above with a subterminal black bar and light tip; feet yellow; the female is smaller and less reddish below. It is found all over the United States and in Cuba, and from ocean to ocean; it is rare in the British Atlantic provinces, though common on the Columbia river. The flight is extremely rapid and long continued, but not at a great height, and accompanied by a whistling noise; it walks with ease and grace, and runs swiftly; it seldom bathes, but drinks by swallowing water in long draughts, with the bill deeply immersed; it is rather shy, and difficult to shoot from the rapid flight; 200 or 300 constitute a large flock, which scatter over so large a space that it is not easy to kill more than one at a shot, except in winter when they come near farm houses; the flesh is excellent, and great numbers are killed in the southern states in winter. In Louisiana they begin to lay by the last of March, but in New England not before the middle of May; the nest is made in any kind of tree, and is very loosely constructed; it breeds in aviaries, raising several broods in a season. The eggs are 2, 1½ by ¾ inch, equally rounded at both ends, and pure white.—None of the turtle doves commit serious depredations in the fields of grain, as they are rather gleaners than reapers. The family characters have been given under Pigeon.

TUSCALOOSA, a W. co. of Alabama, intersected by the Black Warrior and Sipsey rivers; area, 1,620 sq. m.; pop. in 1860, 28,206, of whom 10,145 were slaves. The surface is hilly and the soil highly fertile. The productions in 1850 were 626,452 bushels of Indian corn, 50,271 of oats, 114,035 of sweet potatoes, and 73,561 bales of cotton, the largest growth of cotton in any county of the Union. There were 5 tanneries, 2 cotton factories, 1 paper mill, 8 newspapers, 53 churches, and 404 pupils attending public schools. Iron ore, bituminous coal, and carboniferous limestone are found.—TUSCALOOSA, the capital of the county, and formerly of the state; is situated on the left bank of the Black Warrior river, at the head of steamboat navigation, 125 m. N. W. from Montgomery; pop. in 1860, 3,989. It is the seat of the university of Alabama, and of the state lunatic asylum. The university buildings are elegant and costly. It

carries on an active trade in cotton, and has iron and cotton manufactories.

TUSCANY (It. *Toscana*), a division of central Italy, formerly an independent grand duchy, bounded N. W., N., and N. E. by Modena and the Romagna, E., S. E., and S. by Urbino, Perugia, Orvieto, and Viterbo, and S. W. and W. by the Mediterranean sea. In the new kingdom of Italy it comprises the 7 provinces of Arezzo, Florence, Grosseto, Leghorn, Lucca, Pisa, and Sienna, that of Leghorn including the island of Elba; area, 8,712 sq. m.; pop. in 1860, 1,815,243. The principal cities and towns are Florence, the capital, Leghorn, Lucca, Pisa, Sienna, and Arezzo. In the S. the coast is indented by several bays, but in the N. it forms one long continuous sweep without harbors. The shore, though occasionally bold, is for the most part low and swampy. In the interior the country presents 4 different regions: the highlands of the Apennines on the N. and N. E.; the hilly tract which occupies nearly the whole of the province of Sienna; the valleys of the principal rivers; and the plains which border the Maremma or marshes on the west. The Apennines have none of their principal heights within the limits of Tuscany, the most elevated point being the Bosco Lungo, on the borders of Modena, 4,200 feet above the sea; few of the other summits are more than half this height, and the average elevation is estimated at 1,900 feet. With the exception of a small portion of the N. E., belonging to the Adriatic, the whole drainage of the surface flows to the Mediterranean by numerous streams, the most important of which are the Arno, Cecina, Ombrone, Albegna, Fiora, and Tiber, the last of which, however, has only the upper part of its course in Tuscany.—In the more elevated parts of the country the climate in winter is severe, and snow often lies for a month; but in the valleys vegetation is scarcely interrupted. At Florence the average temperature is 59°, and the sirocco is not uncommon. Fevers, dropsy, and several other complaints are common in the marshy tracts, particularly in the autumn, when these districts are almost entirely deserted by the inhabitants. The other parts of the country are particularly healthy, the ratio of deaths in some years not exceeding 1 in 40 of the population, and never exceeding 1 in 36.—Some of the loftier summits are barren, but in general all the land which, from its elevation or the unevenness of its surface, cannot be cultivated, is covered with forests and natural pastures. About $\frac{1}{4}$ of the area is clothed with forests and plantations of chestnuts, and about the same extent with pastures; while $\frac{1}{4}$ is planted with vines and olives, and the remainder is arable land. Agriculture is more advanced than in any other part of Italy except Lombardy, but is still in a backward state. The principal crops raised are rice, barley, rye, pulse, maize, and wheat, a peculiar species of the last being cultivated solely for its straw;

but the quantity of grain produced is not sufficient for the wants of the inhabitants. A good deal of attention is paid to the culture of the vine, and in many places where the hills are naturally steep artificial terraces have been made on which it thrives well. The olive is extensively cultivated, but the quality of the oil produced is not very good. Various kinds of fruit are abundant; the mulberry thrives and the annual produce of silk is estimated at 250,000 lbs. Large numbers of sheep are fed on the highlands in summer and in the marshes during the autumn and winter; and a considerable quantity of cheese is made from the milk of ewes and goats. The asses of Tuscany are very large; and a great number of pigs are fed upon acorns in the woods of the Maremma. The manufactures consist of woolen and silk goods, hemp and linen cloth, paper, glass, leather, wax, hardware, china and earthenware, alabaster ornaments, coral, which is gathered on the coast of Barbary and worked at Leghorn, and straw plait, of which however the quantity made has greatly declined. A considerable trade is carried on, the chief exports, in addition to several of the articles just enumerated, being oil, timber, charcoal, raw and spun silk, potash, hides, cheese, borax, tartar, gall nuts, and tallow.—The inhabitants are generally honest, sober, and industrious. The Roman Catholic is the established religion, and the total number of the clergy is about 15,000, but all denominations enjoy equal political rights. In the large towns there are about 7,000 Jews. The church establishment of Tuscany consists of 4 archbishops, those of Florence, Lucca, Pisa, and Sienna, and about 20 bishops. There are universities at Pisa and Sienna, attended together by about 800 students. The people are better educated in Tuscany than in any other part of Italy.—The greater part of ancient Etruria is included in Tuscany. (See ETRURIA.) After the fall of the Roman empire it became a province of the kingdom of the Goths, next of the Lombards, and then of the empire of Charlemagne, who governed it by counts. These afterward assumed the title of marquis, and as vassals of the empire continued to rule till 1160, when the last of them sold his marquisate to the emperor Frederic I. It subsequently became divided into a number of small fiefs; and the cities of Florence, Pisa, and Sienna each became the centre of a celebrated republic. Florence, having conquered Pisa, became the predominant power of Tuscany. After the fall of that republic in 1532 Charles V. appointed Alessandro de' Medici, an illegitimate son of the duke of Urbino, duke of Florence. In 1569 the whole of Tuscany became united under the Medici family, when Cosmo I. assumed the title of grand duke. This family maintained one of the most brilliant courts in Europe, and distinguished themselves by their patronage of literature and art. They became extinct in 1737, and according to agreement between the great powers were suc-

ceeded by Francis, duke of Lorraine, who had married Maria Theresa, heiress of Charles VI. of Austria; and while he resided at Vienna Tuscany was governed by a regency. In 1765 Francis (II. of Tuscany and I. of Germany) died, and was succeeded as grand duke of Tuscany by his second son Leopold I., under whom the country made considerable advances. Leopold having succeeded to the Austrian dominions (1790), the grand ducal crown devolved upon his second son Ferdinand III., who followed the enlightened system of his father. In the war of the French revolution he remained neutral, but this was not regarded by the French, and in 1799 the directory ordered the country to be occupied by its troops. By the peace of Lunéville in 1801 Tuscany with Parma was called the "kingdom of Etruria," and given by Napoleon to the prince of Parma as a compensation for territories of which he had been deprived; but in 1807 it was united to the French kingdom of Italy, and Napoleon's sister Elisa, the princess Bacciochi, was placed at the head of the administration with the title of grand duchess. In 1814 Tuscany was occupied, in the name of Ferdinand (II., by the allied troops; and in the following year, at the congress of Vienna, Elba and some other territories were annexed to it, and the possession confirmed to Ferdinand and his successors. The duchy of Lucca was conditionally assigned to Maria Louisa, ex-queen of Etruria, and reverted to Tuscany in 1847. Ferdinand's son and successor Leopold II. followed the example of Naples in March, 1848, and granted a constitution to the people, but becoming alarmed afterward fled to Sienna and subsequently to Gaëta. The members of the provisional government assembled at Florence proclaimed a republic, March 18, and the national assembly that met on the 28th named Guerrazzi dictator. The constitutional party succeeded in driving the republicans from power without bloodshed, and invited Leopold to return without calling in the assistance of the Austrians. This request he promised to comply with, but an Austrian division under Gen. D'Aspre soon afterward arrived, by secret convention, and under their protection the grand duke returned to Florence in 1850 and suppressed the constitution. The people remained quiet until April 27, 1859, when a popular demonstration, immediately following the outbreak of the Italian war of that year, caused the grand duke to offer them a constitution. As they placed no faith in his promises, it was suggested that he should abdicate in favor of his son. This he refused to do, and on the same day left Florence for Bologna. A provisional government was immediately formed, which conferred the dictatorship on the king of Sardinia, who appointed a commissioner to govern the country during the war with Austria. A national assembly met Aug. 20, 1859, and voted to annex Tuscany to Sardinia. The question was afterward submitted to the peo-

ple, and their approval of the annexation was almost unanimous.

TUSCARAWAS, an E. co. of Ohio, intersected by the Tuscarawas river; area, 520 sq. m.; pop. in 1860, 32,468. The surface is undulating and the soil fertile. The productions in 1850 were 350,773 bushels of wheat, 402,761 of Indian corn, 278,500 of oats, 504,178 lbs. of butter, 68,096 of tobacco, and 176,200 of wool. There were 18 grist mills, 38 saw mills, 2 iron foundries, 5 woollen factories, 16 tanneries, 87 churches, 8 newspapers, and 6,927 pupils attending public schools. Iron ore and bituminous coal abound. The Steubenville and Indiana railroad and the Ohio canal pass through the county, and the Tuscarawas branch of the Cleveland and Pittsburg railroad terminates at New Philadelphia, the capital.

TUSCARORAS, a tribe of North American Indians, who at the settlement of North Carolina occupied a tract of land along the banks of the Neuse and Tar rivers, and the country adjacent. They lived for a long time on peaceful terms with the settlers, and in 1708 had 15 towns on the upper waters of those rivers, and could bring into the field 1,200 warriors. Becoming jealous at length of the encroachments of the whites, they formed a league with the Pamlico Indians, and in 1711 attacked the settlers on the Roanoke; 112 of the whites were butchered in the first attack, and a war of attack and reprisal was carried on between the settlers and the Indians for more than 18 months. In March, 1713, the settlers pursued them to their fort on the Neuse in the limits of the present Greene co., and after a severe battle carried the fort, taking 800 captives, while about 800 were killed. This severe defeat, and the subsequent zealous pursuit of those who had escaped, broke the spirit of the Tuscaroras; they entered into a treaty of peace with the governor, and a tract of land on the Roanoke in the present county of Bertie was granted them for a settlement. The hostility of the settlers, however, made their residence uncomfortable, and not long after they joined their kinsmen the Iroquois in the vicinity of Oneida lake. They were formally received into the Indian confederacy about 1722. For a long time they remained quiet, or only aided in the enterprises of the other tribes without being specially identified; but in the revolutionary war a part of them, under the influence of Sir John Johnson, became allies of the British government, while another portion took sides with the colonists. In the outrages and massacres of that period in the region watered by the Mohawk and its tributaries, they bore their full part. In 1779 those who were the allies of the English removed to Niagara co. to obtain means of living, and were granted a small tract of land there by the other tribes. About 1804 they disposed of their lands in North Carolina and purchased a tract from the Holland land company. These lands are still held by them, and the remnant, about 50 fam-

Mice, still remain there, and have adopted the habits of civilization and become industrious and intelligent agriculturists.

TUSCULA, an E. co. of the S. peninsula of Michigan, bounded N. W. by Saginaw bay and intersected by the Cass river; area about 700 sq. m.; pop. in 1860, 4,886. The surface is level, the soil productive, and timber is abundant. Capital, Vassar.

TUSCULUM. See **FRASCATI**.

TUSSER, THOMAS, an English poet, born at Rivenhall, near Witham, Essex, about 1515, died in London about 1580. He became a chorister in the collegiate chapel of Wallingford castle, and subsequently was employed in various other choirs, and finally served as a retainer in the family of William Lord Paget. Afterward he became a farmer at Katwade, now Cattiwade, in Suffolk, where he wrote his work on husbandry entitled "A Hundreth Good Pointes of Husbandrie" (1557). This was the first didactic poem in the language, and in 1578 appeared in an enlarged form as "Fine Hundreth Points of Good Husbandrie vnited to as many of Good Huswiferie" (reprinted by Dr. Mavor in 1812). Fuller says Tusser was "successively a musician, schoolmaster, serving-man, husbandman, grazier, poet, more skilful in all than thriving in any vocation. He traded at large in oxen, sheep, dairies, grain of all kinds, to no profit. Whether he bought or sold he lost; and, when a renter, impoverished himself and never enriched his landlord."

TUTENAG. See **NIOKEI**, vol. xii. p. 849.

TUTHILL, LOUISE CAROLINE (HUGGINS), an American authoress, born in New Haven, Conn., near the beginning of this century. She was married in 1817 to Mr. Cornelius Tuthill, a lawyer of distinction, who died in 1825. After his death she became a contributor to several magazines, and in 1827 published "James Somers the Pilgrim's Son," and in 1829 "Mary's Visit to B." In 1839 she first appeared under her own name as the editor of a volume of selections entitled "The Young Ladies' Reader," which was soon followed by a collection of tales and essays under the title of "The Young Ladies' Home." She afterward wrote three series of tales, which have had a very large circulation, and in 1846 published a novel entitled "My Wife;" in 1848, "The History of Architecture;" and in 1849 "The Nursery Book." She now (May, 1862) resides at Princeton, N. J.

TUTUILA. See **NAVIGATORS' ISLANDS**.

TVER, a government of European Russia, bounded N. W. and N. by Novgorod, E. by Jaroslavl and Vladimir, S. by Moscow and Smolensk, and W. by Pskov; area, 26,081 sq. m.; pop. in 1858, 1,491,427. The surface, though not mountainous, is considerably elevated in the S., and slopes toward the N., where it terminates in an extensive plain. It is watered by numerous rivers, the chief of which are the Volga, which becomes navigable in this government, the Dvina, Tvertza, Sestra,

Shosha, and Mologa. The Volga is connected with the Neva by canal. There are several lakes, the most extensive of which covers 76 sq. m. The soil is of inferior quality, and the quantity of grain raised is scarcely sufficient for the consumption of the inhabitants. A large portion of the surface is covered with forests, consisting principally of birch, beech and pine. The railway connecting Moscow with St. Petersburg passes through the province, and, together with its water communication with the Baltic, Black, and Caspian seas, gives it an important transit trade. There are few manufactures.—**TVER**, the capital, is situated at the junction of the rivers Tvertza and Tmaka with the Volga, 96 m. N. W. from Moscow; pop. about 24,000. It is divided into 4 parts by the rivers, has wide, regular streets, a large Gothic cathedral, and numerous churches ornamented with spires and gilded domes, an imperial and an episcopal palace, 3 monasteries, and several schools and charitable institutions. The rivers are crossed by 8 bridges of boats, and their banks are lined with quays which are favorite promenades. Linen, canvas, hardware, leather, and candles are manufactured; and an extensive trade is carried on in grain, hemp, fish, and iron. Tver was destroyed by fire in 1768, and rebuilt by Catherine II.

TWEED (anc. *Tvada*), a river of Scotland and England, which rises at Tweedshaws, at the S. extremity of Peeblesshire, 1,600 feet above sea level, among the Lowther hills, whence it runs about 20 m. N. E., and then turning E. passes the town of Peebles, crosses the counties of Selkirk and Roxburgh, separates Berwickshire from the English county of Northumberland, and for the last 4½ m. of its course lies wholly within English territory. It enters the North sea at the town of Berwick. Its length is 95 m., and it drains an area of 1,870 m., being more than any other Scottish river except the Tay. Its principal affluents from the N. are the Biggar, Gala, Leader, and Adder, and from the S. the Yarrow, Etrick, Teviot, and Till. It is navigable only a few miles from its mouth, but is remarkable for its salmon fisheries and its picturesque scenery.

TWEEDDALE. See **PEEBLES**.

TWESTEN, AUGUST DETLEV CHRISTIAN, a German Protestant theologian, born in Gluckstadt, Holstein, April 11, 1789. Having studied theology and philosophy at the university of Kiel, he was appointed in 1813 professor at one of the gymnasia of Berlin, where his theological views were chiefly shaped by the influence of Schleiermacher. He became in 1814 extraordinary, and in 1819 ordinary professor of theology at the university of Kiel, and soon obtained, next to Claus Harms, the greatest influence in the Lutheran church of Holstein. In 1835 he accepted a call to the university of Berlin, as successor of Schleiermacher, and in 1861 was appointed a member of the newly created *Oberkirchenrath* (supreme ecclesiastical council) of the United Evangelical church of Prussia.

Twisten is regarded as one of the chief representatives of those who think that they can reconcile, in the main, the peculiar views of Schleiermacher with the old doctrines of the Lutheran church. His principal work is a volume of lectures on the doctrines of the Lutheran church (*Vorlesungen über die Dogmatik der evangelisch-lutherischen Kirche*, 2 vols., Hamburg, 1826-'37); and beside several other theological and philosophical works, he has published a handbook of logic (Kiel, 1834).

TWICKENHAM, a village and parish of Middlesex, England, on the Thames, opposite Richmond, with which it is connected by a handsome bridge, 11½ m. W. S. W. from London; pop. in 1861, 6,264. It is celebrated as the residence of Pope. The poet's villa has been destroyed, but the grotto which he constructed and the monument erected by him to his mother are still standing; and his own monument is in the parish church, where he was buried. Walpole's seat, called Strawberry Hill, is about 1 m. distant. At Twickenham is also Orleans house, occupied by Louis Philippe while a refugee in England before his accession to the throne.

TWIGGS, a central co. of Georgia, bounded W. by the Ocmulgee river; area, 400 sq. m.; pop. in 1860, 8,320, of whom 5,318 were slaves. The surface is moderately hilly and the soil fertile. The productions in 1850 were 379,537 bushels of Indian corn, 76,328 of sweet potatoes, and 9,689 bales of cotton. There were 12 churches, and 210 pupils attending public schools. The Georgia central railroad crosses the N. border. Capital, Marion.

TWIGGS, DAVID EMANUEL, an American general, born in Georgia in 1790. He entered the United States army in 1812 as captain of the 8th infantry, and after the peace of 1815 was retained in the service as captain in the 5th infantry, with the brevet rank of major. In 1825 he was appointed major and in 1831 lieutenant-colonel in the 1st infantry, and in 1836 colonel of the 2d dragoons. He was attached to the invading army of Gen. Taylor in the spring of 1846, and for his services at the battles of Palo Alto and Resaca de la Palma, where he commanded the right wing, was in June of the same year commissioned a brigadier-general. He subsequently received the brevet rank of major-general and a sword from Congress "for gallantry and good conduct in storming Monterey." He commanded a division under Gen. Scott in the campaign of 1847, and in 1848 was military governor of Vera Cruz. In Feb. 1861, being in command of the military department of Texas, he surrendered his troops and munitions of war to the authorities of the state, which had recently adopted an ordinance of secession; and upon his arrival soon after in New Orleans, he was received by the inhabitants with an enthusiastic ovation. On March 1 he was expelled from the U. S. army, and soon after received an important command in that of the "confederate states,"

which however he resigned toward the close of the year.—LAWI, an American soldier, brother of the preceding, born in Richmond City, Ga., in 1798, killed at Chapultepec, Mexico, Sept. 13, 1847. He entered the U. S. service in 1818 as 2d lieutenant in the marine corps, and was the senior officer of marines on the frigate President during her last cruise under Decatur. After being variously employed on sea and land, he volunteered for the Mexican expedition under Gen. Scott, and fell mortally wounded while heading one of the storming parties in the assault upon Chapultepec.

TWILIGHT, the faint light which appears in the sky a little before sunrise, and again for some time after sunset, the amount and duration of the light varying materially in different latitudes and at different seasons of the year. The light is caused by the reflection of the sun's rays, when below the horizon, from the vapors and minute solid particles floating in it, and perhaps from the material atoms of the air itself. It is to this property of reflection possessed by the atmosphere that its illumination is due beyond the direct reach of the rays proceeding from the sun, as under the shadow of clouds and behind opaque objects upon the surface, where, unless the light were directed upon some principle of general diffusion, intense darkness would prevail. So also a sudden illumination would attend the rising of the sun and instantaneous darkness accompany his setting. As the sun sets to any point upon the surface of the earth, the atmosphere above this point all around the horizon is illuminated by direct rays, and the reflection from so broad an illuminated surface brings down to the earth a large amount of light; but as the dark shadow of the earth, in consequence of the continued sinking of the sun, rises higher and higher into the atmosphere at this locality, the reflected light steadily diminishes and finally disappears when no direct rays from the sun reach the higher regions of the atmosphere above the horizontal line extended toward the sunset. By observing the time after the setting of the sun to the disappearance of the reflected rays, data are afforded upon which an approximate estimate may be made of the height of the atmosphere; and it is on this method chiefly that this calculation is based. On the equator, when the sun is in the equinoctial, and apparently descending vertically, and occupying as much time below as above the horizon, the duration of the twilight is an hour and 12 minutes, or $\frac{1}{15}$ of the semi-circumference, equal to 18°; whence it is concluded that such must be its depression below the horizon at any place before the twilight can end; and it is reckoned from this that the height of the atmosphere is a little over 52 m. But this cannot be otherwise than a rude approximation, the calculation proceeding on the supposition of there being but one direct reflection, whereas the rays may be reflected again and again; and no account being made of the refraction the rays must experience in their direct passage

through the dense stratum of air near the surface, and entering it again when turned back from the upper strata. By a different calculation, founded on observations of the progress of the edge of the dark shadow (known till it reaches the zenith as the anti-crepuscular, and afterward as the crepuscular curve), made in the pure and transparent air at the summit of high mountains, the height of the atmosphere has been found by French astronomers (whose observations are recorded in the *Annuaire météorologique de France*, 1850) to be 71.46 m. This curve they found set when the sun was 17° below the horizon. The variable length of twilight at the same place in different seasons results from the varying declination of the sun and the consequent difference of time required to sink 17° or 18° below the horizon, as his course is vertical or more or less approaching it. Near the poles, where the sun attains at noon no great height above the horizon, it also keeps near it after disappearing each night; and if its depression does not exceed 18° , the twilight is continuous into the dawn of the morning. This is the case in some portion of the summer in all places for which the least polar distance of the sun is only 18° greater than the latitude; and as this distance diminishes and the sun is less and less depressed below the horizon, the twilight increases in brilliancy, and is finally lost during the period that the circuit of the sun is above the horizon.—A beautiful feature attending the twilight is the rich coloring of the clouds upon which the direct rays of the sun strike, and from which they are reflected in gorgeous tints, which slowly change their hues as the angle of reflection varies. This phenomenon is seen in greatest perfection in mountainous regions and over wide districts, where the air remains in a uniform condition unaffected by local causes. The presence of much moisture is also favorable for the display of the finest colors. Thus at sea, especially in the warm atmosphere of the Gulf stream, these exhibitions are of the finest character, as also over the waters of inland seas. Even when no clouds are formed, brilliantly colored bands are produced along the horizon, which change in a somewhat regular order with the continued rising or declining of the sun. These tints are due to the different powers of penetration possessed by the different rays of which white light is composed. In the same manner as the solar rays are decomposed and present different colors in passing through a piece of glass covered with smoke in layers of different thickness, these rays are also decomposed in penetrating the dense and humid lower strata of the atmosphere. A slight obstruction of this character extinguishes the blue rays, and causes those which pass through to appear of a yellowish red; next to this the yellow is arrested, and the light is orange; till with further obstruction the yellow entirely disappears, and the red rays alone reach the surface.

TWITE. See **LUNNEY**.

TYBEE, an island and sound at the mouth of the Savannah river, Georgia. The sound is more properly a bay of the Atlantic; it extends from Tybee island on the S. to Hilton Head island on the N., and communicates with Warsaw sound at the S. end of the former island and by means of Lazaretto creek, navigable by light-draught vessels, and with Port Royal entrance on the N. by means of Cooper river, Wall's cut, and other navigable channels. The island is about 6 m. long and 8 m. broad. In the civil war of 1861-'2 it was occupied by the U. S. forces, under command of Brig. Gen. Sherman, Nov. 28, 1861, and batteries were subsequently erected on it and the adjacent islands for the reduction of Fort Pulaski at the mouth of the Savannah river, commanded by Col. Olmstead of the confederate army. The bombardment began on the morning of April 10, 1862, from 11 batteries between 1,500 and 3,000 yards from the fort, mounting 20 guns and 16 mortars; and the fort capitulated at 3 o'clock the next afternoon.

TYCHO BRAHE. See **BRAHE**.

TYCHSEN, OLAVUS GERNHARD, a German orientalist, born in Tondern, Schleswig, Dec. 14, 1784, died in Rostock, Dec. 30, 1815. After completing his studies at Göttingen in 1799, he was sent on a mission through Germany and Denmark by Callenberg for the conversion of Jews, but met with no success. In 1799 he became professor of oriental literature at Bützow, and when the university was removed to Rostock in 1799 was appointed chief librarian and keeper of the museum. His most important work is a journal called *Bützow'sche Nebststunden* ("Leisure Hours at Bützow," 6 vols., 1796-'9). He wrote dissertations on the Arabic and Phœnician languages, and made many investigations in the history of Christian sects in Asia.

TYLER. I. A N. W. co. of Virginia, bordering on the Ohio river, and intersected by Middle Island creek; area, 390 sq. m.; pop. in 1860, 6,517, of whom 18 were slaves. The productions in 1850 were 130,014 bushels of Indian corn, 15,100 of wheat, 27,544 of oats, and 1,737 tons of hay. There were 4 grist mills, 9 saw mills, 3 tanneries, 7 churches, and 145 pupils attending public schools. Iron ore, bituminous coal, and excellent building stone and limestone are found in great abundance. Capital, Middlebourne. II. An E. co. of Texas, bounded N. and E. by the Neches river; area, 1,200 sq. m.; pop. in 1860, 4,523, of whom 1,148 were slaves. The surface is level and the soil fertile. The productions in 1850 were 35,099 bushels of Indian corn, 12,320 of sweet potatoes, 33 hogheads of sugar, and 184 bales of cotton. Capital, Woodville.

TYLER, BENNET, D.D., an American clergyman, born in Middlebury, Conn., July 10, 1733, died in South Windsor, Conn., May 14, 1858. He was the son of a farmer, and was put to learn a trade, but entered Yale college, where he was

aduated in 1804, and ordained as pastor of the congregational church in South Britain, Conn., 1808, where he remained 14 years. In 1822 he was elected president of Dartmouth college, and while in this office raised a fund of 10,000 to aid indigent students preparing for the ministry. In 1828 he resigned his presidency and became pastor of the 2d Congregational church in Portland, Me. During the controversy on the "new divinity" awakened by the writings of Dr. Taylor (see TAYLOR, LATHANIEL WILLIAM), he was recognized as the principal opponent of Dr. Taylor's views. His position was essentially that of the great divines of New England, Edwards, Bellamy, Smalley, and Dwight, on the subject of God's sovereignty, decrees, regeneration, man's natural ability and moral inability to obey God's commands, the nature of sin and holiness, and the nature and extent of the atonement. One result of this controversy was the formation of a pastoral union in Sept. 1833, by the Connecticut clergymen who held to Dr. Tyler's opinions, and the resolution to found a theological seminary at East Windsor, Conn., of which he was chosen president, and held that position till his death. His principal works are: "History of the New Haven Theology, in Letters to a Clergyman" (1837); "A Review of Day on the Will" (1837); "Memoir of Rev. Asahel Nettleton, D.D." (Hartford, 1844); "Nettleton's Remains" (1845); "A Treatise on the Sufferings of Christ" (New York, 1845); "A Treatise on New England Revivals" (1846); and two series of "Letters to Dr. Horace Bushnell on Christian Nurture" (1847-8). He also published many sermons and controversial pamphlets. His memoir, by his son-in-law, the Rev. Nahum Gale, D.D., and a volume of lectures have been printed since his death.

TYLER, JOHN, 10th president of the United States, born in Charles City co., Va., March 19, 1790, died in Richmond, Jan. 17, 1862. His father, who bore the same name, was a distinguished patriot in the revolution, and was afterward successively speaker of the Virginia house of delegates, governor of the state, and judge of the federal court of admiralty, an office to which he was appointed by President Madison shortly before his death in Feb. 1818. John was his second son, and in his 12th year entered William and Mary college. At the age of 17 he was graduated, and on that occasion pronounced an address on "Female Education," which the college faculty declared to be the best commencement oration that had ever been delivered before them. After quitting college he studied law, and at the age of 19 was admitted to the bar, and almost immediately entered upon a large practice. Two years later he was elected a member of the legislature from Charles City co. by a nearly unanimous vote. He took his seat in Dec. 1811, and during the ensuing war with Great Britain steadily advocated the policy of Jefferson, Madison, and the other leaders of the

democratic party. He was elected for 5 successive years, on one occasion receiving all the votes polled except 5. In 1816 he was elected to congress to fill a vacancy, and in the following year and again in 1819 he was reelected by increased majorities. While in congress he voted with Mr. Clay for the resolutions of censure on Gen. Jackson's conduct during the Seminole war; and on the question of internal improvements by the general government, he voted against all propositions which countenanced the doctrine of power in the government to make such improvements. He was one of the committee appointed to investigate the concerns of the United States bank chartered in 1816, and supported a resolution inimical to the bank, and in his speech on this occasion took the ground that the creation of such an institution was unconstitutional. In fact, throughout his congressional career he maintained at all points the state rights or strict construction doctrines of the democratic party of Virginia. In 1819 he opposed in the debates on the tariff the protective policy, and on the Missouri question opposed all restrictions on slavery. Ill health compelled him soon after to resign his seat in congress before the expiration of his term, and retiring to Charles City co. he resumed the practice of his profession. In 1828 and the two following years he was a member of the legislature, and took a leading part in the debates of the house of delegates, in which he exerted much influence in behalf of a comprehensive system of internal improvements by the state. In Dec. 1825, he was chosen governor by the legislature by a large majority over Mr. Floyd, and at the next session was reelected by a unanimous vote. He did not however long remain in this office, for on the approach of the expiration of the term of John Randolph as U. S. senator in March, 1827, a portion of the democratic members of the legislature, disgusted with the personal vagaries of that erratic statesman, coalesced with the whigs to elect Governor Tyler, though the political sentiments of the latter were identical with those of Mr. Randolph, and he was chosen on the first ballot by a majority of 5. In the presidential election of 1824 Mr. Tyler had supported for the presidency William H. Crawford of Georgia, who received the electoral vote of Virginia. The house of representatives having decided the election in favor of John Quincy Adams, the Crawford party of Virginia generally were satisfied with that result, and Mr. Tyler wrote a letter to Henry Clay approving of the choice of Mr. Adams in preference to Gen. Jackson. Soon afterward, in a public speech at Richmond, commenting on the first message of President Adams, he said that it had withered all his hopes. "I saw in it an almost total disregard of the federative principle—a more latitudinous construction of the constitution than has ever before been insisted on; lying not so much in the particular measures recommended

—which, though bad enough, had some excuse in precedent—as in the broad and general principles there laid down as the basis of governmental duty. From the moment of seeing that message all who have known any thing of me have known that I stood distinctly opposed to this administration; not from a factious spirit, not with a view to elevate a favorite, or to advance myself, but on the great principles which have regulated my past life.” In the senate Mr. Tyler sided with the opposition to Mr. Adams, consisting of the combined followers of Jackson, Crawford, and Calhoun. He voted against the tariff bill of 1828, and against all projects of internal improvement, making a long speech against the Maysville road bill, and highly approving President Jackson’s veto of that act. During the debate on Mr. Clay’s tariff resolutions in 1831–2, he made a speech which continued during three days, in which he opposed a tariff for direct protection, but advocated a tariff for revenue with incidental protection to home industry. At the same session he opposed the bill to continue the bank of the United States. In 1832 he avowed his sympathy with the nullification movement in South Carolina; and when President Jackson took decided ground against the nullifiers, Mr. Tyler withdrew his support from the administration, and made an animated speech against the force bill, which passed the senate with no vote but his in the negative, Mr. Calhoun and the other opponents of the bill having retired from the chamber. He however voted for Mr. Clay’s compromise bill. His term in the senate expiring March 4, 1833, he was reelected for the succeeding 6 years. In the session of 1833–4 he supported Mr. Clay’s resolutions of censure upon President Jackson for the removal of the deposits, and took an active part in the debate on that question, maintaining that the bank of the United States, though in his opinion unconstitutional, was yet an institution established by law and made by law the depository of the public money, and that therefore the removal of the deposits by the president was an unwarranted assumption of power on the part of the executive. His course at this time on this question was sustained by instructions from the legislature of Virginia; but in Feb. 1836, the legislature adopted resolutions instructing the senators from that state to vote for expunging from the journal of the senate the resolutions of censure upon the president. Mr. Tyler, who at the beginning of his political career had committed himself fully in favor of the right of instruction, could not conscientiously comply with the request of the legislature nor hold his seat in disregard of its mandate, and he accordingly resigned it and returned to his home, which about this time he had removed from Charles City co. to Williamsburg. His course in the senate had gained him a good deal of popularity among the state rights democrats who had arrayed themselves in opposition to Jackson

and Van Buren, and who were to some extent cooperating with the whigs; and in the presidential contest of 1836 he was in Maryland run as candidate for vice-president on the same ticket with General Harrison, the whig candidate for president; while in other states where Judge White of Tennessee was the candidate for president, the supporters of that gentleman also used Mr. Tyler’s name for the vice-president. The result was that he obtained the votes of Maryland, Georgia, South Carolina, and Tennessee. In 1838 he was elected a member of the legislature by the whigs of James City co., and during the subsequent session of that body he acted entirely with the whig party, under which name all branches of the opposition to Jackson and Van Buren had now become united. As a whig also he was chosen one of the delegates from Virginia to the whig national convention which met at Harrisburg, Dec. 4, 1839, to nominate candidates for the presidency and vice-presidency. He exerted all his influence in behalf of Henry Clay, and is said to have wept with sorrow when the convention rejected that statesman and nominated Gen. Harrison for president. As Harrison, however, was from the North, it was expedient to select the candidate for vice-president from the South; and to conciliate the friends of Mr. Clay, and also that portion of the opposition which in 1836 had supported Judge White, and who were still powerful in Tennessee, Georgia, North Carolina, Mississippi, and other southern states, the nomination to the second office was unanimously offered to Mr. Tyler and accepted. During the campaign his speeches, letters, and declarations of opinion were satisfactory to the whigs; and in the political songs which played so conspicuous a part in that memorable struggle, his name, in the popular refrain of “Tippecanoe and Tyler too,” was as great a favorite in the mouths of the whigs as that of the victor of Tippecanoe himself. The result of the election, which took place in Nov. 1840, was the triumphant choice of the whig candidates by 234 electoral votes, Mr. Van Buren, the democratic candidate, receiving only 60 votes, which were those of the states of New Hampshire, Virginia, South Carolina, Illinois, Alabama, Missouri, and Arkansas. President Harrison died April 4, 1841, just one month after his inauguration, and for the first time in the history of the United States the administration devolved on the vice-president. Mr. Tyler was at Williamsburg when the news of Gen. Harrison’s death was communicated to him, and on his arrival at Washington he was waited on by the members of the cabinet, whom he requested to remain in the places they held under President Harrison. Three days later he published an inaugural address, which was well received by the public, and in its indications of political principle was satisfactory to the whigs who had naturally felt much anxiety as to the manner in which the peculiar policy of their party might be carried out by a president so

recently a convert from the most intense school of Virginia democracy. Their satisfaction was increased by the promptness with which the new president began to remove from office the democrats who had been appointed by previous administrations, and to fill their places with whigs—a system of change which he pursued with vigor and perseverance through all branches of the public service. In his message to the congress which convened in extra session, May 31, 1841, the president discussed at considerable length the question of a national bank, which was at that period a leading feature of whig policy. He said: "In intimate connection with the question of revenue is that which makes provision for a suitable fiscal agent, capable of adding increased facilities in the collection and disbursement of the public revenues, rendering more secure their custody, and consulting a true economy in the great, multiplied, and delicate operations of the treasury department. Upon such an agent depends in an eminent degree the establishment of a currency of uniform value, which is of so great importance to all the essential interests of society, and on the wisdom to be manifested in its creation much depends. . . . I shall be ready to concur with you in the adoption of such system as you may propose, reserving to myself the ultimate power of rejecting any measure which may, in my view of it, conflict with the constitution, or otherwise jeopard the prosperity of the country." These and similar expressions were interpreted as indicating that he would sanction any reasonable plan that congress might adopt for the creation of a national bank or 'fiscal agent;' and he intimated to several members his desire that congress should request a plan for a bank from the secretary of the treasury, Mr. Ewing of Ohio, who in his report accompanying the president's message had spoken strongly in favor of such an institution. In compliance with this wish resolutions were introduced into both houses by the president's confidential friends, in obedience to which Mr. Ewing sent in a bill for the incorporation of the "Fiscal Bank of the United States," the essential features of which were framed in accordance with the president's suggestions and in deference to his peculiar views of the institution. It was referred in the senate to a committee of which Mr. Clay was chairman, who soon reported a bill that differed from Mr. Ewing's in no material particular except in relation to the establishment of branch banks, which in Mr. Ewing's plan were to be established only in states that had formally given their assent; while in Mr. Clay's no such assent was required. It was soon understood that the president disapproved of Mr. Clay's bill, on the ground that congress, though it had the power to create a bank, had no power to establish branches; and in order to appease his scruples on this point, a compromise was agreed to by the whig members,

which it was asserted would be satisfactory to him. By this compromise it was arranged that branches might be established with the assent of a state; and if any state did not at the first session of its legislature after the passage of the bill express its dissent, its assent might be presumed by the directors of the bank, who were furthermore required to establish a branch in any state when directed to do so by congress. The bill thus amended was finally passed by congress on Aug. 6 and sent to the president. A report soon spread that he intended to veto it, and various delegations waited upon him to remonstrate against such an act. To one of these delegations, consisting of all the whig members of congress from Ohio, he replied with much emotion and even with tears that he felt the deepest interest in the matter, and desired only that certain constitutional objections should be removed from the bill, and finally asked them: "Why did you not send me Ewing's bill?" "Would you sign that?" said one of them. "I would," was Mr. Tyler's answer. Relying upon this promise, steps were immediately taken by the whig leaders to pass Mr. Ewing's bill; but before that could be done the president declared that he must recall his pledge to sign Mr. Ewing's bill, which he had not then read, but which now on examination he found he could not conscientiously approve. On Aug. 16 he sent the senate bill back to congress with a veto message, in which he argued that the bill was unconstitutional because it attempted to create a bank to operate *per se* over the Union; because it was a bank of discount; because it was not exclusively confined to the power of dealing in exchanges; and lastly, because the assent of the states in the establishment of branches was not sufficiently secured. This veto created great excitement and anger among the whigs throughout the country, who suspected that it was prompted by democratic influence, and that it foreboded the betrayal and desertion by Mr. Tyler of the party which had elevated him into power. The whig leaders in congress, however, made yet another effort to conciliate the president and secure his assent to their favorite measure. He himself said to a member from Ohio that his message contained a plan of a bank which had been long a favorite idea with him. Mr. Berrien of the senate and Mr. Sargeant of the house were accordingly deputed to confer with him and ascertain precisely what kind of a bill he would approve. In an interview held on Aug. 19, he told them he was in favor of a fiscal agent divested of the discounting power, and limited to dealing in bills of exchange other than those drawn by a citizen of one state upon another citizen of the same state. A bill was accordingly prepared embracing these features, was privately submitted to the president and approved by him and his cabinet, and finally without any alteration passed by the house, Aug. 23, and by the senate two weeks

later. While the bill was yet pending in congress a private letter written by John M. Botts, a distinguished whig member of congress from Virginia, to a friend at Richmond, found its way surreptitiously into the newspapers, and is supposed to have had a strong effect upon the action of the president, of whom it said: "Captain Tyler is making a desperate effort to set himself up with the locofocos, but he'll be headed yet, and I regret to say it will end badly for him. He will be an object of execration with both parties; with the one for vetoing our bill, which was bad enough—with the other for signing a worse one; but he is hardly entitled to sympathy. . . . You'll get a bank bill, but one that will serve only to fasten him, and to which no stock will be subscribed; and when he finds out that he is not wiser in banking than all the rest of the world, we may get a better." From this letter the president inferred that the design of the whigs in proposing and passing the new bank bill was merely to "head" him and to "fasten" him by forcing him to subscribe to a measure inconsistent with his previous professions of principle, and he accordingly sent it back to congress with a veto. This act caused great indignation among the whigs, who regarded it as a palpable betrayal of their confidence; while on the other hand it was warmly applauded by their democratic opponents, who held numerous meetings throughout the country to approve the president's course. Two days after the promulgation of the veto, the cabinet, with the exception of Mr. Webster, the secretary of state, sent their resignations to the president; and Mr. Ewing, secretary of the treasury, Mr. Bell, secretary of war, Mr. Badger, secretary of the navy, and Mr. Crittenden, attorney-general, published statements of their reasons for this step, reflecting severely on the conduct of Mr. Tyler. The president promptly filled their places by appointing Walter Forward, of Pennsylvania, secretary of the treasury; John O. Spencer, of New York, secretary of war; Abel P. Upshur, of Virginia, secretary of the navy; Charles A. Wickliffe, of Kentucky, postmaster-general; and Hugh S. Legaré, of South Carolina, attorney-general—all of them whigs, or at least opponents of the democratic party. Before the adjournment of congress, Sept. 18, the whig members subscribed a manifesto and ordered it to be published, in which they proclaimed that all political relations between them and John Tyler were at an end; that from that day "those who brought the president into power could no longer, in any manner or degree, be justly held responsible or blamed for the administration of the executive branch of the government." The course taken by Mr. Webster in remaining in the cabinet while his colleagues withdrew was severely condemned by a portion of the whigs, but was justified by the greater portion of the people on the ground that the critical condition of

our relations with Great Britain on the subject of the north-eastern boundary made it highly desirable that the negotiations on that subject in which he was at the time engaged with the British ministry, should be continued and concluded by him. In the following winter Mr. Ashburton was sent by Great Britain as a special minister to the United States on this subject, and between him and Mr. Webster a satisfactory treaty was arranged, which was ratified by the senate, Aug. 20, 1842. In the following May Mr. Webster resigned, and was succeeded by Mr. Legaré, who died soon after during a visit made by the president and cabinet to Boston to attend the celebration of the completion of the Bunker Hill monument. In July President Tyler reorganized his cabinet as follows: Mr. Upshur, secretary of state; Mr. Spencer, secretary of the treasury; Mr. Wickliffe, postmaster-general; James M. Porter, of Pennsylvania, secretary of war; David Henshaw, of Massachusetts, secretary of the navy; John Nelson, of Maryland, attorney-general. Messrs. Porter, Henshaw, and Nelson were democrats, and the first two were rejected by the senate when their nominations came before it at its next session. In their places the president appointed William Wilkins, of Pennsylvania, secretary of war, and Thomas W. Gilmer, of Virginia, of the navy, who were both confirmed, Feb. 15, 1844. On Feb. 23, however, Mr. Gilmer and Mr. Upshur, while inspecting the U. S. war steamer *Princeton*, were killed by the bursting of one of her guns, and Mr. Calhoun, of South Carolina, was appointed secretary of state, and John Y. Mason, of Virginia, secretary of the navy. Under the able management of Mr. Calhoun a treaty of amerciation was concluded between the United States and Texas, April 12, 1844, which was rejected by the senate. The scheme of annexation, however, was vigorously prosecuted by the president, and at the very close of his administration brought to a successful issue by the passage of joint resolutions by congress, March 1, 1845. The other most important measures of his administration were the act establishing a uniform system of bankruptcy, passed in Aug. 1841, and the tariff law of 1842, by which ample provision was made for the public revenue and protection afforded to American manufactures. The result of the peculiar policy of the president was that toward the close of his term it became evident that he had lost the confidence of the whigs without having secured that of the democrats. There was but one whig in the senate on whose support he could rely, and but 5 or 6 in the house of representatives. He had been persuaded, however, that the mass of the people were attached to him, and that he could be reflected without the support of either of the existing parties; and in May, 1844, a convention composed chiefly of officeholders assembled at Baltimore and tendered him a nomination for the presidency, which he accepted; but in August, perceiving

at he had really no popular support, he withdrew from the canvass. The election in the subsequent November resulted in the choice of James K. Polk as president and of George M. Dallas as vice-president, and in the return of the democratic party to power. Mr. Tyler, after his retirement from the presidency, March 4, 1845, remained in private life till in 1861 he appeared as a member of the peace convention, composed of delegates from the "border states," which met at Washington to endeavor to arrange terms of compromise between the seceded states of the South and the federal government. Of this convention he was elected president, but nothing resulted from its deliberations. He subsequently renounced his allegiance to the United States, and gave his support to the confederate cause. At the time of his death he was a member of the confederate congress, then in session at Richmond. Mr. Tyler was tall and thin in person, with very prominent features and courtly and pleasing address. He was married in 1813 to Letitia, daughter of Robert Christian, of New Kent co., Va., who died at Washington in 1842, leaving 3 sons and 8 daughters. On June 26, 1844, he was married again to Julia, daughter of David Gardiner, of New York, who survives him.

TYLER, ROYALL, an American author and judge, born in Boston, Mass., in 1756, died in Brattleborough, Vt., Aug. 16, 1826. He was graduated at Harvard college in 1776, served for some time on the staff of Gen. Lincoln, and subsequently devoted himself to the practice of the law, and also to some extent to literary pursuits. During a visit to New York in 1786 he produced at the John street theatre "The Contrast," the first American play acted on a regular stage by an established company, and the first also in which an attempt was made to portray the conventional Yankee dialect and character. It had great success, and was followed in the same year by "May Day, or New York in an Uproar." In 1790 Mr. Tyler removed to Vermont, where he became eminent in his profession, beside gaining considerable reputation as a contributor of humorous miscellanies in prose and verse to the periodical press. In 1797 he produced another successful comedy, "The Georgia Spec, or Land in the Moon," and also a novel in 2 volumes entitled "The Algerine Captive." He was for a number of years an associate justice and chief justice of the supreme court of Vermont, and published 2 volumes of reports.

TYLER, SAMUEL, an American author and philosopher, born in Prince George's co., Md., Oct. 22, 1809. He was admitted in 1831 to the Maryland bar, and established himself in Frederic City, where he has since chiefly practised his profession. In 1836 he became a contributor to the "Princeton Review," in which he has published some of his most profound productions. In 1844 he published a "Discourse of the Baconian Philosophy," which gained him the friendship and uninterrupted corre-

spondence of Sir William Hamilton, the Scottish philosopher, the article upon whom in this cyclopædia is from his pen. His remaining works are: "Burns as a Poet and as a Man" (New York, 1848), and "The Progress of Philosophy in the Past and in the Future" (12mo., 1859). He is also the author of a report on the subject of law reform in the state of Maryland.

TYLER, WILLIAM SEYMOUR, D.D., an American clergyman and linguist, born at Harford, Susquehanna co., Penn., Sept. 2, 1810. He was graduated at Amherst college in 1830, and in 1831 became a classical teacher in Amherst academy. He afterward studied at Andover theological seminary, and was licensed to preach by the 8d presbytery of New York city in 1836, but, being elected professor of the Latin and Greek languages and literature in Amherst college about the same time, was not ordained till 22 years later. In 1847 the professorship of ancient languages was divided, Prof. Tyler retaining that of Greek. In 1855 he visited Europe and the East. In 1847 he published "The Germania and Agricola of Tacitus," followed by "The Histories of Tacitus" (1848) and "Plato's Apology and Crito" (1859). His other works are: "Prize Essay on Prayer for Colleges" (1854), and a "Life of Dr. Henry Lobdell, Missionary at Mosul" (Boston, 1859). He has also contributed numerous articles to the "Biblical Repository," "Bibliotheca Sacra," "American Theological Review," and other periodicals, among which is a series still in progress in relation to the opinions and views of the poets and philosophers of ancient Greece on the character of the Supreme Being, on sin and its expiation, and other points of natural theology; the titles of some of these are: "Theology of Æschylus," "Theology of Sophocles," "Socrates as a Teacher," "The Homeric Doctrine of the Gods," "The Homeric Doctrine of Sin and its Expiation," &c.

TYMPANUM. See EAR.

TYNDALE, WILLIAM, an English reformer and translator of the Bible, born at North Nibley, Gloucestershire, probably in 1484, executed at Vilvoorden, in Brabant, Oct. 6, 1536. He was educated first at Oxford (where for a while he was tutor), and afterward at Cambridge, took orders as a priest, and was received as instructor in the house of Sir John Walsh near Bristol. The reformation from the beginning had enlisted his sympathy, and while he was a tutor in this family he translated the *Enchiridion Militis*, or "Soldier's Manual," of Erasmus into English. His boldness of speech soon brought him into suspicion, and for a larger field and more security he went to London, where he began his translation of the New Testament. He was soon compelled to flee again, and having received the promise of an annuity of £10 from Alderman Munmouth, with the condition that he should pray for the souls of the alderman's parents, he went to Hamburg, where for a year he gave himself to his work; thence to Cologne, where the first 10 sheets of his trans-

lation were put to press; and thence to Worms, where in 1525 two editions were published anonymously. They had speedy and wide circulation. The edict of the bishop of London, forbidding under heavy penalties their use or their possession, only increased the demand. Tyndale was lampooned and vilified by Sir Thomas More in 7 books of elaborate abuse, in which he was pronounced a blasphemous beast, only fit for burning; and plots were laid to arrest him, which he foiled by removing in 1528 to Marburg, where he published his work on the "Obedience of a Christian Man." In 1529 a 5th edition of the New Testament was printed; and in 1530 appeared Tyndale's translation of the Pentateuch. The deceitful invitations to return to England he was too wise to accept; but his friend and assistant John Frith was less wary, and suffered at the stake in 1533. A new edition of the New Testament, revised and corrected, was issued at Antwerp in 1534, in which Tyndale avowed his responsibility for the work. But an emissary of Henry VIII., acting in concert with the clergy and magistrates of Brussels, procured his arrest in the house of Pointz, where he had found refuge, and carried him to Vilvoorden, where there was a strong prison. His sentence was pressed by the English king and by the neighboring university of Louvain; and authority having been given to proceed against heretics in this kind by a decree of the emperor made in the assembly at Augsburg in 1530, Tyndale was strangled and burned at the stake. The spot is still shown near the site of the new penitentiary. It is recorded that he suffered bravely, and that his last words were a prayer for the king of England. The works of Tyndale and Frith, which were collected and published after the reformation was established, were issued in London in 3 vols. 8vo. in 1831, and by the "Parker Society" (3 vols., 1848-'50). The translation of the New Testament was the principal model and basis of King James's version, and its diction is but little more obsolete than the diction of that version. A beautiful edition of it was published in London in 1836, edited by George Offor (reprinted, Andover, Mass., 1837).

TYNE, a river of Northumberland, England, formed by the junction of the North and South Tyne, the former of which rises in the Cheviot hills, on the border between England and Scotland, and the latter in the N. W. part of Cumberlandshire. These two streams unite near Hexham in the S. part of Northumberland, and the Tyne thence has a course of 85 m., generally E., to the North sea. For the last 18 m. it forms the boundary between Northumberland and Durham. It is navigable by vessels of 300 or 400 tons as far as Newcastle-upon-Tyne. Its principal affluent is the Derwent. At its mouth on the N. is the town of Tynemouth, which with North Shields adjacent forms a parliamentary borough (pop. in 1861, 38,991). The place is fortified, and the British government has recently strengthened

the defences, and is now (1863) engaged in constructing here a vast breakwater with the design of forming a harbor of refuge. The Tyne is the great mart of the sea-borne coal trade, and once possessed valuable salmon fisheries.

TYNG, STEPHEN HIGGINSON, D.D., an American clergyman, born in Newburyport, Mass., March 1, 1800. He was graduated at Harvard college at the age of 17, was engaged for two years in mercantile pursuits, began the study of theology under Bishop Griswold in 1819, and was ordained deacon at Bristol, R. I., March 4, 1821. Having labored for ten years at Georgetown, D. C., and for 6 years in Queen Anne's parish, Prince George's co. Md., he removed to Philadelphia in May, 1829, to take charge of St. Paul's church in that city. He received the degree of D.D. from Jefferson college in 1832, and from Harvard in 1851. In May, 1833, he became rector of the church of the Epiphany, Philadelphia; and on the death of the Rev. Dr. Milnor in 1845, he became his successor in St. George's church, New York, of which he is still rector (1862). He has published "Sermons preached in the Church of the Epiphany, Philadelphia" (1839); "Lectures on the Law and the Gospel" (1848); "Israel of God;" "Recollections of England;" "Family Commentary on the Four Gospels" (1849); "Christ is All" (1849); "Bible Companion;" "Christian Titles;" "The Rich Kinsman: the History of Ruth the Moabitess" (1855); "The Captive Orphan: Esther the Queen of Persia;" "The Child of Prayer," a memorial of his son, the Rev. Dudley A. Tyng; "Forty Years' Experience in Sunday Schools," &c.

TYPE (Gr. *τύπος*, to stamp), a piece of metal or of wood, having the form of a letter or other character in relief upon one end, used in printing. The various forms of type have been described in the article PRINTING, vol. xiii. p. 587; that article also contains the history of their invention, the methods of their use, &c. Types are usually composed of an alloy known as type metal, which formerly consisted of 75 parts of lead and 25 of antimony. A harder alloy was afterward substituted for this, especially for the smaller letters, consisting of 50 parts of lead, 25 of tin, and 25 of antimony. Other compositions have also been used, in one of which, known as Didot's metal, 1 part of copper is united with 3 each of lead, tin, and antimony. While such mixtures produce a desirable amount of hardness, they are apt to be brittle, and thus fail to retain the sharp lines of the letter upon which their value depends. The composition of type metal varies, however, with different foundries, each of whom adopts the alloy which he considers the most durable and best suited to the peculiar style and size of the type cast.—The principal instruments used in the casting of types are the punch, matrix, and mould. The punch is a well tempered piece of steel, on one end of which is carefully cut in bold relief a character which is the exact counterpart of the finished

pe. The cutting of the punches is a very tedious process, requiring great skill on the part of the workman; and the number of those who are adepts in the art is comparatively few. As a separate punch is necessary for each letter or character of every font or size of type, their preparation is the most expensive preliminary connected with type founding. Upon the punch being finished and hardened, the end with the character engraved upon it is struck with great force into a piece of copper, which is then called the matrix, and which forms a mould for the face of the type; and the sides and end of the matrix are accurately squared, in order that when fitted to the mould it shall be perfectly true and properly connect with that portion of the latter which is to form the shank or body of the type. Matrices are also formed by the deposition of copper on type by the electrotype process, for the purpose of copying or reproducing a particular size or style without the expense of cutting new punches. All the characters of a font may thus be reproduced once by passing the faces through holes in thin strips of brass and fastening these together by clamps, or connecting the bodies in a solid mass by means of melted wax. The mould in which the type is cast by hand is an instrument of two parts, each made of steel, and backed with wood for facility in handling when the metal parts become heated. The two parts of the mould are so made that they can be fitted quickly and accurately together. The necessary quantity of metal is poured into a square pening in the top, beneath which is the cavity that forms the mould for the body of the type, with the matrix at the bottom to form the face or character. The caster then gives the mould an adroit jerk upward, thereby expelling the air and forcing the fluid metal into all the recesses and cavities of the matrix. When the metal becomes sufficiently hard, the caster separates the two parts of the mould and removes the type by a small hook. By this process an expert workman can cast from 400 to 500 types per hour. In the early part of the present century experiments began to be tried with a view of producing a machine which should cast types faster than could be done by the hand process; and about the year 1825 Mr. Elihu White of New York succeeded in inventing the first machine for this purpose. This was considerably modified and improved upon at various times by Mr. David Bruce, until in 1850 the most perfect machine at present in use was produced, the patent right of which is owned by the firm of James Conner's sons, type foundry, of New York. This has at its back a small pot of metal, which is kept in a fluid state by a coal fire beneath; at the bottom of the metal pot is a small hole or well in which a piston is inserted. The front part of the machine consists of an ingenious modification of the hand mould, in which the matrix is fitted, having a spring pressing upon it to keep it in its place. Upon motion being given

to the machine, by a crank and fly-wheel at the side, the piston in the metal pot is raised sufficiently to allow the necessary quantity of metal to pass into the well; the piston, descending, forces the metal forward through an appropriate channel into the mould; the pressure of the spring upon the matrix is relieved, allowing it to fall back sufficiently to release the face of the type; the upper part of the mould rises, carrying the type with it, which, striking against a projection for the purpose, drops into a trough and slides into a box in front of the machine. At the next revolution of the wheel, the pressure of the spring being restored, the matrix is returned to its place, and the mould closes ready for the reception of the metal to form another type. Each turn of the crank produces a type, and the speed of casting is limited only by the time necessary to be allowed for the cooling of the metal in the mould; this is at the rate of one per minute of the largest size to 150 per minute of the smallest. Each machine is adapted to cast type of a certain series of sizes, the smallest being equal to one half of "nonpareil," and the largest equal to 7 lines of "pica." These machines are now very generally used both in America and Europe, and in some foundries are run by steam power; they have occasioned a great reduction in the cost of type. The old hand mould is now seldom used except for casting large ornamental and fancy type, or those which are "kerned" or have projections extending over the body of the type. Each type as cast has a small piece of metal attached to the bottom of its body, being the surplus metal poured into the mould; this is broken off by a boy at the rate of 2,000 to 5,000 an hour. The flat sides of the type are then rubbed upon a piece of gritstone to render them free from roughness, generally by young women. They are then set up in long lines, and secured together while the dresser scrapes or polishes the flat surfaces on the top and bottom of the body, cuts a groove along their lower ends by a small plane, and carefully examines the face of the types to remove any defective letters. All the types of one font have one or more corresponding nicks or grooves across the front edge near the bottom, which generally vary in position or number with each font, and are formed by the insertion of wires in the mould, or cut by the dresser when the types are secured in lines for his inspection. Upon leaving the dresser the types are arranged in lines of convenient length and the requisite number of each character for a font selected, when they are ready for the use of the printer.—The rapid wear of fonts of type, and of stereotype plates made of the same metal, has long rendered it desirable to make them entirely of a better material, or to devise some method of adding to the durability of that already in use. This object was accomplished by the invention of what is known as copper-facing, made by Dr. L. V. Newton of New York, and patented in Aug. 1850. This

consists in depositing over the character only of the type, or the face of the stereotype plates, a coating of copper by the galvanic process. (See *ELECTRO-METALLURGY*.) This invention was first applied in practice to the New York "Courier and Enquirer," "Herald," and "Tribune;" and in 1851 it was brought into use in England. The same year it was also introduced into France and copper-faced types were used in 1852 for the *Revue des deux mondes* and "Galignani's Messenger." The types are generally regarded as possessing more than twice the durability of those not thus protected. About two years before this invention, M. Petit had produced in France types made entirely of copper, the density of which was considerably increased by the pressure to which the metal was subjected in the steel dies and matrices in which the types were shaped as they were cut from the long strips of prepared metal.—Wood is used for the large types of handbills and "posters," the sizes of which range from 4 lines up to 150 lines "pica." The wood selected is prepared in the same manner as that employed in wood engraving, maple being most used. (See *ENGRAVING*, vol. vii. p. 208.) The outline of the letter or character is first carefully cut upon the face of the block with a graver. It is then placed upon a table under a drill or cutter which revolves vertically with great rapidity. This, by an arrangement of wheels and rollers, can be moved by a lever in any direction over the face of the block, and it quickly cuts away the superfluous portions of wood, leaving the character standing in bold relief. The block is then passed to the engraver, who gives it the finishing touches with the graver.—Types were first manufactured in the United States by Christopher Sower at Germantown, Penn. He cast several fonts for himself and others in both German and English characters, and the anvil on which he forged the matrices is still to be seen at Germantown. Sower was a publisher of German books, and it was for the purpose of supplying the Scriptures to his countrymen at a cheap rate that he undertook this manufacture and that of printing ink. The monopoly enjoyed by the universities in Great Britain of printing English Bibles was thus the cause of the first Bibles printed in this country being in German. Christopher Sower, jr., continued the business, and the type manufacture descended from him to Messrs. Binney and Ronaldson of Philadelphia, who about the beginning of this century cast all the types made in the United States, and introduced a modification of the type mould which was the first real improvement in type founding since its early establishment. It was introduced into Europe by the name of the "American mould." Among the other type founderies of the last century, none of which however continued permanently in operation, was that of a Mr. Michelson from Scotland, who made very good types in Boston in 1768. Abel Buell, of Killingworth, Conn., an inge-

nious gold and silversmith, received aid during the war from the colony in establishing a type foundry at New Haven, and for this purpose made use of the Sandemanian meeting house in Gregson street. Dr. Franklin brought him from Europe in 1775 the materials for a complete type foundry, which he fitted up at Philadelphia, especially designing it for his grandson Mr. Bache. Mr. John Baine, a type founder of Edinburgh, removed to Philadelphia not long after the war, and established a foundry in which he cast the types for a portion of the edition of the "Encyclopædia Britannica" which was republished by Thomas Dobson, the first volume in 1790. Before the close of the century David Bruce from Edinburgh established the same business in New York, and in 1818 the firm of David and George Bruce commenced the first stereotype foundry in the United States. George Bruce was the inventor of the type called secretary or ronde, and several valuable improvements in the type and stereotype manufacture were introduced by this family.

TYPE SETTING MACHINE. See *PRINTING*, vol. xiii. p. 589.

TYPHOID FEVER, an acute, febrile, contagious disease, occurring but once in the same individual, and having as an anatomical characteristic a peculiar alteration of Peyer's glands. On the subject of essential fevers, as they are termed, inextricable confusion exists among the older writers. Fevers in all probability essentially the same are described under different names and as distinct diseases, while on the other hand distinct diseases are confounded together. This confusion has remained down to our own time, vitiating the histories and descriptions of writers upon the subject. The minute and truthful account of Louis, connecting the history and symptoms of typhoid fever with its characteristic anatomical lesion, first led the way to the distinctions which have since obtained, and now ephemeral and relapsing, typhus and typhoid fevers are almost universally admitted as distinct diseases. The causes of typhoid fever are still a matter of doubt. That it is infectious is beyond dispute; patients brought into a hospital where typhoid fever prevails are seized with it, and it spreads in private houses where there is crowding or deficient ventilation; but it occurs in other cases where contagion would seem out of the question. In England, many have connected it with defective and insufficient sewerage; while others, locating the infectious principle in the discharges from the bowels, interpret by the light of their own theory the facts seen by the former class of observers. It is remarkable that the disease has for many years been endemic in New England, while it would seem to be replaced by malarious fevers in the other parts of the Union. It is confined to no age, but is most common in young adults; according to Louis, those between 18 and 30 years of age are most exposed to its attacks; it is rare

in infancy, but gradually increases in frequency with advance in age; after 50 years of age its occurrence is entirely exceptional. Sex and season would seem to exercise but little influence, but, like other contagious diseases, it sometimes prevails epidemically. A strange theory has been started in France connecting the prevalence of typhoid fever with the general diffusion of vaccination. Though supported by an appeal to statistics, the notion has no real foundation, while it is contradicted by the fact that typhoid fever occurs equally and with the same severity among the vaccinated and the unvaccinated.—The disease may be preceded by diarrhoea, pains in the limbs, and a sense of weariness and weakness. It commences with chills alternated with heat, with pain in the head, back, and limbs, and with sudden prostration of strength; there are giddiness and ringing in the ears, loss of appetite, sleeplessness or disturbed sleep, and increased frequency of pulse. Diarrhoea is often present from the first; sometimes it supervenes during the first 2 or 3 days; in rare instances (3 cases in 101, Barth) it is wholly absent or the bowels are constipated. The diarrhoea varies in intensity; sometimes there are but 2 or 3 stools in the 24 hours, more commonly 6 or 8, occasionally 15 or 20. The stools are thin and offensive, vary in color, and occasionally contain blood. Colicky pains occur in the bowels, and these, particularly in the right iliac fossa, are somewhat sensitive to pressure; strong pressure in the same region commonly produces a gurgling sound. As the disease advances, *meteorismus* occurs, the bowels becoming distended with gas and tympanitic. The tongue is at first coated, red at the edge, and tremulous; afterward it becomes more or less dry; in bad cases it may become hard, black, covered with sores, and cracked; sometimes in very bad cases it is thickened, swollen, and hard. Headache, as was before mentioned, occurs in the commencement; the pain is dull and heavy, and is commonly seated in the forehead; as delirium supervenes, it disappears. In exceptional cases it is excessively severe, and continues throughout the course of the disease. The prostration of the patient, strongly marked at the commencement, increases as the case advances, and is accompanied by giddiness and confusion of thought. The patient has a dull, confused look; when spoken to, he seems slow of comprehension, and answers hesitatingly. Stupor occurs in many cases, sometimes earlier, sometimes later in the disease; the patient seems most of the time sunk in a heavy slumber, from which he is for the most part easily roused; this slumber brings with it no refreshment, and when questioned the patient declares that he has not slept at all. In cases of any severity, more or less delirium constantly occurs, coming on chiefly at night; often when roused the patient will answer a few questions rationally, and then lapse again into delirium; it is commonly mild, but sometimes

furious, making it necessary to use force to restrain the patient. Attendant upon the delirium occurs irregular and spasmodic contraction of the muscles, *subcultus*, *tendinum*, &c. The countenance when the disease is fully developed is commonly dusky, the face somewhat flushed, the cutaneous circulation slow. Very generally in the course of the disease a peculiar eruption makes its appearance, consisting of small, round, rose-colored spots (*taches roses lenticulaires*), slightly elevated above the surface, and varying from $\frac{1}{4}$ to $\frac{1}{2}$ of an inch in diameter. They are commonly observed on the belly or the lower part of the chest, sometimes on the upper part of the thighs, rarely over the whole surface. The eruption ordinarily commences about the 7th day, sometimes later. The spots do not all appear at the same time, but a few, perhaps only 2 or 3, will show themselves; after 3 or 4 days these fade, being in the mean time replaced by others. Sudamina, minute colorless vesicles closely crowded together, show themselves in a majority of cases; their principal seats are the neck and the epigastrium. Petechiae occasionally occur, but they are exceptional phenomena. The fever is almost invariably attended with cough, sometimes trifling, occasionally severe and harassing. Auscultation commonly discovers dry rronchi throughout every part of the chest; occasionally large crepitation is present; percussion is normal unless there is some complication. The pulse in bad cases is small, weak, and frequent; occasionally it is preternaturally slow.—The duration of typhoid fever varies from 15 days to 7 weeks or longer; when the disease is protracted, sloughs are apt to form over the parts most exposed to pressure, particularly the sacrum and hips. When the case is fatal, death most frequently occurs between the 15th and 30th days. A very frequent and feeble pulse, great oppression of breathing, low delirium alternating with stupor or coma, great *meteorismus*, frequent or involuntary stools, and retention of urine are all very unfavorable symptoms. Occasionally considerable quantities of blood are passed by stool, and in rare instances perforation of the bowels takes place and the patient dies of peritonitis. The characteristic lesion found after death from typhoid fever is the affection of Peyer's glands; these are swollen by a deposit beneath the mucous membrane of a peculiar, homogeneous, amorphous, friable matter (typhoid deposit), which, softening and becoming discharged, leaves an oblong ulceration, the greatest diameter of which corresponds with the long diameter of the intestines. The mesenteric glands corresponding to the portion of the intestine affected with the ulceration are swollen and altered. The spleen is found swollen and softened.—As in other specific diseases, the treatment of uncomplicated typhoid fever consists mainly in placing the patient under favorable hygienic circumstances, in the early administration of suitable nourishment, and, in severer cases and the

more advanced stages of the disease, in the administration of tonics and stimuli, according to the requirements of the system. (See TYPHUS.)

TYPHON, in Greek mythology, a monster of the primitive world. Hesiod makes him the son of Typhoeus, but the two are confounded in the later writers. The common account made him the son of Tartarus and Gæa, and destined to revenge the defeat of the Titans by the Olympian gods. Another form of the legend represented him as having been born to Juno by her own unaided generative forces, on account of her anger at Jupiter for having given birth to Minerva. According to Pindar, Typhon was larger and stronger than any thing to which the earth had given birth; his head reached to the stars, his eyes darted fire, his hands extended from the east to the west, terrible serpents were twined about the middle of his body, and 100 snakes took the place of fingers on his hands. Between him and the gods there was a dreadful war, and in one account he stormed Olympus and drove the immortals to Egypt. Jupiter finally killed him with a flash of lightning, and buried him under Mt. Ætna. The legend of Typhon is simply symbolical of earthquakes and violent winds, and the devastation caused by them.

TYPHON, or SEM, an Egyptian deity. See DEMON, vol. vi. p. 368.

TYPHOON. See HURRICANE.

TYPHUS, a continued contagious fever, attended with great prostration of the vital powers, and characterized by the occurrence of a mulberry-colored rash, somewhat resembling that of measles. Until within a short period, under the names of continued fever, nervous, putrid, ataxic, adynamic, gastro-enteric fever, &c., typhus and typhoid fever were confounded together. Dr. Gerhard of Philadelphia, so recently as 1887, was the first perhaps to point out the distinct character of the two diseases; the late Dr. Elisha Bartlett, in his work on the fevers of the United States (Philadelphia, 1847), advocated similar views; finally, Dr. Jenner of London, in an elaborate work "On the Identity or Non-Identity of the Specific Causes of Typhus, Typhoid, and Relapsing Fevers" (London, 1850), appears to have placed the question beyond the limits of controversy. The two diseases resemble each other very strikingly in their commencement, their course, and the great fatality that attends them. They both begin commonly with chills, sudden prostration of strength, pain in the back and limbs, and increased frequency of pulse; but the diarrhoea so constantly present in typhoid fever is as commonly replaced by constipation in typhus; the pains in the bowels, the tenderness, the tendency to tympanitis, and the gurgling in the iliac region on pressure of typhoid fever, are absent in typhus; while the head symptoms—the pain, the confusion of thought, the noise in the ears, the delirium—are more aggravated. The eruption still more distinctly characterizes the two diseases. In

typhoid fever it is confined commonly to the abdomen and lower part of the thorax, and consists of small, distinct, rose-colored circular spots, readily disappearing under pressure. In typhus the eruption is dark, mulberry-colored, aggregated in patches, not completely disappearing under pressure, diffused over the surface, and commonly largely intermingled with petechiæ. In the course of the disease the body often exhales a peculiar and offensive smell. The mortality of typhus is greater than that of typhoid fever, but different epidemics vary greatly in fatality; in the typhus that raged so widely in the United States in 1848-9, resulting from the extensive immigration from Ireland caused by the famine there, patients from some ships communicated an intense form of the disease than those from others. The average duration of typhus is however much shorter than of typhoid fever. Sometimes patients die as early as the 3d or 4th day; and when convalescence takes place, it is rarely protracted beyond the 28th or 30th day.—On post-mortem examination, the alteration of Peyer's glands, the characteristic of typhoid fever, is not found, nor does our present knowledge of pathological anatomy enable us to point to any condition which is essential. A change in the character of the blood itself, and some little softening and congestion of various viscera, are all that is constantly found.—The essential cause of typhus is contagion, and without the presence of the fever itself the other causes would remain inoperative. Crowding and want of ventilation have long been known as fertile aids to the diffusion of typhus, and the disease has taken different names, as jail fever, camp fever, and hospital typhus, according to the different causes which favored its spread. Privation and want of sufficient food strongly predispose the system to receive the contagion, and famine in Ireland is invariably attended and followed by fever. The disease was formerly endemic in most of the large cities of Great Britain and Ireland, particularly in Ireland and Scotland, but improved municipal regulations have almost banished it from a number of them; its spread is in a great measure under the control of hygienic regulations, and its continuance as a distinct disease is due to their imperfection and neglect.—In the treatment of typhus, rigid attention to cleanliness, the abundant access of fresh air, frequent tepid sponging of the surface, and the support of the patient by a light nutritious regimen, are the main elements of success. In cases attended with great prostration, wine, whey, wine, malt liquors, or distilled spirits must be used freely and frequently; and under their use cases apparently desperate often recover. The celebrated Dr. Huse of Stockholm, from an experience in 3,186 cases, prefers dilute phosphoric acid as a tonic in the commencement of almost all cases of typhus and typhoid fever, and regards it as alone sufficient to relieve or cure the majority of cases. The severest forms

require the most powerful tonics, such as quinine, beef tea, brandy, &c., aided by phosphoric or other mineral acids. (See TYPHOID FEVER.)

TYPOGRAPHY. See PRINTING.

TYRANT, in ornithology. See KING BIRD.

TYRANT (Gr. *τυραννος*, a ruler or sovereign), a term used in ancient Greek history principally to designate the autocratic rulers of independent states who obtained their power not by legal appointment, but by usurpation, generally connected with the subversion of the revulsionally established constitution. A despot or bloody rule, however, was not originally implied in the appellation. The so called 30 tyrants of Athens, who on the termination of the Peloponnesian war received the sway over that city from the Spartan Lysander, did not all deserve that appellation in its more modern and odious sense.—For the “30 tyrants” in Roman history, see GALLIENUS.

TYRE (In classical writers, *Tyros*; in the Hebrew Scriptures, *Tzor*, rock), the wealthiest and most powerful city of Phœnicia, founded by the Sidonians, in a naturally strong position on the coast of the Mediterranean, about 20 m. S. from Sidon. In later times it extended over a small adjacent island, the new part gradually becoming the more important, and the old receiving the name of Old Tyre (*Παλαιτύρος*). The latter is designated in the historical books of the Old Testament as the “stronghold” or “fortress” (*mishtaar*) Tzor, while, no doubt in allusion to its insular part, the city is called by Isaiah the “stronghold of the sea,” and described by Ezekiel, in his glowing picture of its wealth, splendor, and maritime power, as situated “in the heart of the seas.” Both parts withstood a long siege by Shalmaneser of Assyria, but only that built on the island is believed to have successfully resisted a longer one by Nebuchadnezzar; while Alexander the Great, by the construction of a mole from the mainland to the island, succeeded in reducing the whole of Tyre. This mole, gradually enlarged and strengthened by ruins and alluvial deposits, has since permanently connected the two sites of the ancient city, converting the island into a promontory. Even the ruins of the “daughter of Sidon” and mother of Carthage have mostly been covered by the sea. On the site now stands a poor village called Sur. (For the history of Tyre, see PHœNICIA.)

TYROL, or **TIROL**, a province or crownland of Austria, bounded by Württemberg, Bavaria, Salzburg, Carinthia, Venetia, Lombardy, Switzerland, and Liechtenstein, between lat. 45° 39' and 47° 46' N., and long. 9° 35' and 13° E.; area, 11,084 sq. m.; pop. in 1857, 851,016. It includes the Vorarlberg, which was formerly a separate district or province, and is divided into the 4 circles of Innsbruck, Brixen, Trent, and Bregenz. The chief towns are Innsbruck, the capital, Roveredo, Feldkirch, Botzen, Bregenz, and Brixen. The surface is throughout mountainous, and the scenery bears a strong resemblance to that of Switzerland.

It is traversed from W. to E. by three chains of the Alps, which run nearly parallel to each other. The Rhaetian Alps, which occupy the centre and are the loftiest, divide the waters which flow northward to the Danube from those that run to the Adriatic or the river Drave, and unite on the E. with the Noric Alps. The highest points in the Austrian empire are situated in this chain, Mt. Ortler being 12,852 feet above the sea, and the Gross-Glockner 12,776 feet. The northern chain forms the Tyrolese or German Alps; and the southern is sometimes called the Trent Alps, and is united on the E. with the Carnic Alps. The S. side of these chains is generally abrupt, but on the N. the descent is mostly gradual, and by terraces with many valleys between them. Many of the summits are above the line of perpetual snow, and about 160 sq. m. are covered with glaciers. These chains are crossed by several of the lowest passes of the Alps, the most important of which are the Brenner, Malserheide, Timbljoch, Arlberg, Schloßberg, Achen pass, and the pass near San Pellegrino. Many rivers have their sources in the Tyrol, and it is watered by numerous streams and mountain torrents. The most important rivers are the Inn, which enters the Tyrol from Switzerland by a narrow valley at Finstermünz, and has a course of about 100 m. within the country; and the Adige, which has an E. S. E. course, and after its junction with the Eisack becomes navigable; but the currents of both are rapid, more especially after the melting of the snow on the mountains. The Tyrol has numerous lakes, the largest of which are Lakes Idro, Garda, Constance, Achen, and Plan, the first 3 of which lie on the frontiers. Granite is the commonest rock on the mountain ridges; but the geological formations on the N. and S. sides differ very considerably. On the N. the rocks are almost entirely calcareous, and on the S. the granite is overlaid by primitive schists and limestones, while lower down a great variety of rocks appear. The most valuable minerals are gold, copper, lead, iron, calamine, coal, rock salt, and fine marble. The climate in the lateral valleys, and in the N. and W., is very severe, but in the S. it is much milder. The mean annual temperature at Innsbruck, 1,700 feet above the sea, is 49°, while at Botzen, 1,010 feet lower, it is 55.80°. The annual fall of rain averages 26 inches, and is pretty equal throughout the country. About $\frac{1}{3}$ of the surface is occupied by perpetual snows, glaciers, and barren rocks; an equal space by forests; and the remainder by extensive tracts of natural pasture, by arable land, vineyards, and gardens. Wheat, rye, barley, and oats are grown, and in some places buckwheat is extensively cultivated. Millet, flax, hemp, and tobacco are also raised; and maize forms one of the principal crops in the valleys that lie on the borders of Italy. Fruit of different kinds is abundant in the same locality, and a considerable quantity of wine and silk is produced.

Large numbers of cattle are kept, and goats and sheep are particularly numerous, but pigs are rare. The wild animals include the chamois, hare, and marmot; and there are several birds of prey, especially eagles.—About $\frac{2}{3}$ of the population are of German descent, and the remainder Italians; both are Roman Catholics, and distinguished for the strength of their devotional feelings. They are honest, frank, and very industrious. About 80,000 of them annually migrate during the summer months to the surrounding countries, and return about the end of autumn with the profits of their labor. The manufactures, though numerous, are not very extensive, and include lace, embroidery, gloves, hardware, cutlery, and toys. Mines of copper and lead are worked, and gold and silver are procured in small quantities. An important transit trade is carried on, but the commerce of the country is not very extensive, and consists chiefly of dried fruit, cheese, wine, cattle, timber, iron, salt, &c. Innsbruck is connected by railway with Munich and Salzburg, and Botzen with Verona. There is a university at Innsbruck, and the province has 45 superior, several infant, and between 8,000 and 4,000 popular schools.—In early times the Tyrol was inhabited by the Rhetians and Celtic tribes, and under the Roman empire formed part of Rætia, having been subdued in the reign of Augustus. During the decline and after the fall of the western empire it was several times ravaged by barbarians, was successively occupied by the Ostrogoths, Lombards, Bavarians, and Franconians, and afterward divided into petty lordships, all of which paid tribute to the dukes of Bavaria. These lordships subsequently became united, and the whole of the territory passed to the house of Austria by inheritance in 1363. Austria retained peaceable possession of it till 1805, when she was compelled to cede it to Bavaria by the peace of Presburg. The people were highly dissatisfied with this arrangement, and under Andreas Hofer rebelled in 1809; but the Bavarians and French reentered the country, and the people were subdued. In the last action the women fought by the side of the men, and nearly 400 of them were cut down by the enemy's cavalry. The Tyrol was restored to Austria by the congress of Vienna.

TYRONE, a N. county of Ireland, province of Ulster, bounded by Londonderry, Lough Neagh (which separates it from Antrim), Armagh, Monaghan, Fermanagh, and Donegal; area, 1,260 sq. m.; pop. in 1861, 238,426. The chief towns are Strabane, Dungannon, and Omagh. The surface is greatly diversified, and has many fertile plains and valleys. The only considerable rivers are the Foyle and Blackwater. Coal is found, but turf is the usual fuel. The Londonderry and Enniskillen railroad passes through Tyrone near Strabane. The county returns two members to parliament.

TYRREL, an E. co. of North Carolina, bordering on Albemarle and Pamlico sounds, and

including Roanoke island in the latter, intersected by Alligator river; area, 820 sq. m.; pop. in 1860, 4,948, of whom 1,597 were slaves. The surface is level and the soil sandy. The productions in 1860 were 7,952 bushels of wheat, 149,385 of Indian corn, and 20,745 of sweet potatoes. There were 21 shingle mills, 12 churches, and 400 pupils attending public schools. A large portion of the county is covered with swamps and heavy forests of pine, cypress, and red cedar; and shingles, staves, tar, and turpentine are extensively exported. Capital, Columbia.

TYRTÆUS, a Greek poet of the 7th century B. C., variously stated to have been a native of Attica and of Lacedæmon. An ancient tradition recounts that, in the second Messenian war, the Spartans were commanded by an oracle to apply to the Athenians for a leader. In answer the Athenians, opposed to the extension of the Spartan dominion, sent Tyrtæus, a schoolmaster of low family and reputation, and deformed, as the most unfit person they could select for the purpose. But he so inspired the Spartans with his war songs, that the Messenians were subdued to the condition of helots. His poems were of two kinds: marching songs in anapestic measures, to be sung with the music of the flute; and elegiac exhortations to constancy and courage. The fragments of them are in Gaisford's *Poeta Minores Græci* (translated into English verse by Polwhele, 1786-92).

TYRWHITT, THOMAS, an English author, born in London, March 29, 1730, died there, Aug. 15, 1786. He was educated at Eton and at Queen's college, Oxford, where he took his degree of A.B. in 1750, and in 1756 was appointed under secretary of war, which position he exchanged in 1762 for that of clerk of the house of commons. He resigned office in 1768, and devoted the remainder of his life to literary pursuits. Two years previous to his death he was appointed a trustee of the British museum, to which institution he bequeathed a portion of his valuable library. His principal works in English are: "Observations on some Passages in Shakespeare" (8vo., Oxford, 1766), and an edition of Chaucer's "Canterbury Tales" with an "Essay on his Language and Versification, an Introductory Discourse, and Notes" (5 vols. 8vo., London, 1775-'8). He also aided in the publication of Chatterton's "Poems by Rowley," and supported the authorship of them by Chatterton in a reply to the strictures of Dean Miller and Jacob Bryant. He was an accomplished Greek scholar, and published notes, animadversions, and conjectures on writings by Plutarch, Babrius (the supposed author of Æsop's fables), Euripides, Strabo, and others. His principal work in this department of literature was an edition of Aristotle's "Poetics," published posthumously in 1794.

TYTLER. I. WILLIAM, a Scottish author, born in Edinburgh, Oct. 12, 1711, died Sept. 12, 1792. By profession he was a writer to the signet, but his reputation rests chiefly upon

a work published in defence of Mary, queen of Scots, entitled an "Inquiry, Historical and Critical, into the Evidence against Mary, Queen of Scots," &c. (1759), and which gained him from Burns the title of "revered defender of the beauteous Stuart." He also published the "Poetical Remains of James I., King of Scotland" (8vo., Edinburgh, 1788), and some miscellaneous papers. II. ALEXANDER FRASER (Lord Woodhouselee), a Scottish jurist and author, son of the preceding, born in Edinburgh in Oct. 1747, died there, Jan. 5, 1813. He was called to the bar in 1770, and in 1786 was appointed professor of universal history and Roman antiquities in the university of Edinburgh, in which capacity he prepared a course of lectures subsequently embodied in his well known "Elements of General History" (Edinburgh, 1801), afterward published in "Murray's Family Library." In 1790 he was appointed judge advocate of Scotland, and in 1802 a judge of the court of session, with the title of Lord Woodhouselee. His remaining works comprise an "Essay on the Principles of Translation," a "Life of Lord Kames," a treatise on "The Law of Courts Martial," two supplements to the "Dictionary of Decisions," and a variety of miscellaneous minor publications. He was the intimate friend of Dugald Stewart, Scott, Mackintosh, Mackenzie, and other eminent authors, and one of the most estimable and accomplished gentlemen of his time. III. PATRICK FRASER, a Scottish author, son of the preceding, born in Edinburgh, Aug. 30, 1791, died in Malvern, England, Dec. 24, 1849. He was admitted in 1818 into the faculty of advocates, and for many years steadily practised his profession, which he finally relinquished for the more congenial pursuit of literature. His first literary efforts of importance were published in "Blackwood's Magazine," to which he became a contributor at the time of its first appearance in 1817; and somewhat later he produced a "Life of Orickton" and a "Memoir of Sir Thomas Craig of Riccarton." In 1822 he became one of the founders of the Bannatyne club, a circumstance which drew him into still closer association with literary men and antiquaries; and about 1825, at the suggestion of his friend Sir Walter Scott, he commenced his "History of Scotland," the work on which his reputation mainly rests, and which was completed in 1843, after 18 years of labor, in 9 vols. It embraces the period between the accession of Alexander III. in 1249 and the union of the crowns of England and Scotland in 1603, professes to be built upon "unquestionable monuments," and is still the standard work on the subject. The article "Scotland"

in the "Encyclopædia Britannica" is also by Mr. Tytler. His remaining works comprise a "Life of Wickliff," published anonymously in 1826; "Lives of Scottish Worthies," forming 3 vols. of "Murray's Family Library;" a "Life of Sir Walter Raleigh," containing many new facts carefully digested from state papers; a "Historical View of the Progress of Discovery in America;" a "Life of King Henry VIII.;" and a number of minor productions. The latter part of his life was passed in England. His biography, written by the Rev. John Burgon (1859), represents him as a pious, cheerful, and affectionate man, beloved by all who knew him. In addition to his other acquirements, he was an excellent musician, and wrote verses considerably above mediocrity.

TZETZES, JOANNES, a Greek scholar and poet, who flourished at Constantinople about the middle of the 12th century. He was distinguished with the title of grammarian, then commonly given to the learned. His works consist of poems, scientific treatises, and commentaries on ancient authors. His poems are the *Iliake*, containing the whole Trojan story from the birth of Paris to the return of the Greeks from Troy; *Βυζαντινὰ ἱστορικά*, more commonly called *Chiliades*, a collection of 668 mythical and historical stories; and *Carmen Iambicum*, on the education of children. Of his commentaries, only those on the Iliad, on Hesiod, and on Lycophron have been printed.

TZSCHIRNER, HEINRICH GOTTLIEB, a German theologian, born at Mitweida, Nov. 14, 1778, died Feb. 17, 1828. He studied theology at Leipsic, became academic *Docent* at Wittenberg, entered holy orders in 1801, and was appointed professor of theology at Wittenberg in 1805, and at Leipsic in 1809. He accompanied as chaplain the troops of Saxony from Weimar to Tournay in 1818, and became the successor of Rosenmüller as superintendent at Leipsic in 1815, and prebendary of Meissen in 1818. He was one of the most effective opponents of the Catholic reaction in Germany. Among his more important works are a continuation of the church history of Schröckh (3 vols., Leipsic, 1810); *Protestantismus und Katholicismus aus dem Standpunkte der Politik betrachtet* (1822; translated into English, French, and Dutch); *Das Reactions-System* (1824); *Briefe eines Deutschen an die Herren Châteaubriand, De Lamennais, &c.* (edited by Krug, 1828); *Vorlesungen über die christliche Glaubenslehre* (by Hase, 1829); and *Der Fall des Heidenthums* (unfinished, by Niedner, 1829). He was highly esteemed as an academic lecturer and pulpit orator, and published several volumes of sermons.

U

U, the 21st letter and 5th vowel of the English alphabet. It is not found in the Semitic languages, which have no distinct letters for vowels proper, and was probably originally wanting in the Greek, in which its modern equivalent is *ou*; in the Hebrew its place is supplied by the letter *vav*, and in the Armenian by *hioun*, both of which are pronounced sometimes as vowels and sometimes as consonants. In the Latin also it frequently had the force of a consonant, as in the words *uaco*, *uolox*, *silua*, now written *vaco*, *velox*, *silva*. It was in fact constantly confounded with *V*, and for some time a distinction was made between *U* vowel and *U* consonant, the latter name being applied to the character *V*, which did not come into use until after *U*. In the first books printed with Roman characters *V* was used as the capital for both sounds, and *u* as the small letter. In the Gothic alphabets the distinction was made much earlier than in the Latin. In English, *u* has 4 sounds, as exemplified in the words *but*, *bull*, *unite*, and *rule*. In the last it has the sound of *oo*, which is the normal one of the Italian, Spanish, German, and Slavic *u*; the 3d is pronounced as if the *u* were preceded by *y*. In French the letter has a sound of its own, which cannot be represented in our tongue, and resembling the German *ü*.—*U* is interchangeable with *a*, as in the Arabic definite article, which is rendered *ul* and *al*, or in Germ. *Hut*, Eng. *hat*; with *i*, as Lat. *maurum* and *maximus*; with *o*, as Lat. *dulcis*, It. *dolce*; with the diphthongs *æ* and *œ*, as Lat. *cura*, old form *coira* or *corra*, Lat. *murus*, Gr. *μωρα*; with *au*, as Lat. *mus*, Ger. *Maus*; with *e*, as Lat. *Siculus*, Gr. *Σικελος*, Lat. *tabula*, Ger. *Tafel*, Ger. *Ulme*, Eng. *elm*; with *l*, as Eng. *stout*, Ger. *stolz*, Fr. *autel*, Eng. *altar*. *U* never occurs in ancient Latin inscriptions, *V* being used instead. (See LANGUAGE, vol. x. p. 298.)

UBICINI, JEAN HENRI ARDOLONYME, a French author, born in Issoudun, department of Indre, Oct. 20, 1818. He was educated at the lyceum of Versailles, and for several years taught rhetoric at the college of Joigny. In 1846 he visited Italy, and afterward travelled in Greece, Turkey, and the Danubian principalities. Being at Bucharest when the revolution broke out there in 1848, he took an active part in it, and became secretary of the provisional government. When the Turkish and Russian troops occupied Wallachia, he returned to France, after visiting Constantinople, and published *Lettres sur la Turquie* (2 vols., 1849-'51; translated into English, London, 1856); *La question d'Orient devant l'Europe* (1854); *La Turquie actuelle* (1855); *Les provinces Roumaines*, forming part of the *Univers*

pittoresque (1856); *La question des principautés Danubiennes devant l'Europe* (1858); and an introduction to the "Ballads and Popular Songs of Roumania" (1855). He has also translated the *Saturnalia* of Macrobius (1845) and edited the works of Voiture (2 vols. 12mo., 1856), and for two years was editor of the *Revue de l'Orient*; beside which he has written for the *Paris Presses and Siècle*, and the *Courrier de Paris*.

UOCELLO, PAOLO, an Italian painter, born in Florence about the middle of the 14th century, died, according to Vasari, in 1432. He was a contemporary of the sculptors Ghiberti and Donatello, and the first painter who developed the principles of perspective. He painted principally in fresco, and was fond of depicting birds and animals, an example of which occurs in his illustrations of the histories of Adam and Eve and of Noah and the deluge, in the church of Sta. Maria Novella in Florence. Few of his works now remain.

UDALL, NICHOLAS, an English author, born in Hampshire in 1506, died in 1564. He was educated at Corpus Christi college, Oxford, was master successively of Eton and Westminster schools, and in the early part of the reign of Edward VI. was appointed to a canonry at Windsor. He published "Flovres for Latyne Spekyngs" (London, 1533), a series of selections from Terence; some translations from the Latin works of Erasmus; and a Latin tragedy, *De Papatu* (1540); but his chief claim to remembrance is that he was probably the first writer of regular English comedies, divided into acts and scenes. Of these Wood says that he wrote several, but only one is extant, entitled "Ralph Royster Doyster," reprinted by the Shakespeare society (London, 1847).

UDINE, or **UDINEZ**, a town of Austrian Italy, government of Venice, capital of the delegation of Udine or Friuli, situated in an extensive plain on the canal of La Roja, 80 m. by railroad N. E. from Venice, and 40 m. from Trieste; pop. about 80,000. It is walled and fortified, and has a fine cathedral ornamented with marble pillars, bass-reliefs, and paintings, a lyceum, a gymnasium, several hospitals and charitable institutions, and a monumental pillar, by Camilli, in one of the public squares, erected to commemorate the peace of Campo Formio, that village being but 1½ m. from Udine. A height near the centre of the town is occupied by a castle which has been converted into a prison. The Campo Santo is one of the finest cemeteries in Europe. The principal manufactures are silk, linen, and woollen goods, earthenware, hardware, paper, leather, and liqueurs.

UDO. See **AUDRIA**.

UGGIONE, MARCO DA. See **OSGIORZ**.

UHLAND, JOHANN LUDWIG, a German lyric poet, born in Tübingen, April 26, 1787. He was educated at the university of his native place, where he applied himself to legal studies, and after being an advocate received in 1810 the degree of doctor of laws. He first appeared in print in Seckendorf's *Musenalmanach* (1806 and 1807), in *Der Poetische Almanach* (1812), and in *Der Deutsche Dichterwald* (1813). After a literary journey to Paris, he began the practice of law in Stuttgart, in which city he also held for a long time a position in the office of the minister of justice. The national struggle against the French during the years 1813-15 strongly excited his feelings; and when the king of Württemberg determined in 1815 to give his people a new constitution, Uhland, who was a strong adherent of the liberal party, took an active part in the contest between the supporters of the old and new systems. He wrote numerous lyrics, the influence of which was not confined to Württemberg, though relating to Württemberg interests. In 1815 appeared the first collection of his *Gedichte*, and from that time to 1819 his poetic labors were arduous, but were interrupted by the share he took in political movements, and also by his application to severer literary studies. In 1819 and 1820 he was elected from Tübingen, and later from Stuttgart, to the representative assembly of Württemberg, where he exerted much influence. In 1822 he published an essay *Ueber Walther von der Vogelweide*. In 1830, having given up his legal practice, he was made extraordinary professor of the German language and literature in the university of Tübingen, but this position he resigned in 1838, as he could not be released from his duties in order to attend the sittings of the diet, to which he was a deputy, and in which he was one of the most prominent members of the constitutional opposition. In 1836 appeared at Stuttgart his work entitled *Ueber den Mythos der nordischen Sagenlehre von Thor*, which was followed in 1844-'5 by a collection of popular songs under the title of *Alter hoch- und niederdeutscher Volkslieder*, both works being the fruits of profound researches into the literary history of the middle ages. He declined to appear as a candidate in the election of 1839, and lived for several years in retirement. In 1848 he was sent by the electoral division of Tübingen to the national assembly at Frankfurt, where he acted with the liberal party. Since this he has remained in retirement. Beside the works already mentioned, he has written two dramas, *Herrzog Ernst von Schwaben* (Heidelberg, 1817), and *Ludwig der Bayer* (Berlin, 1819). Several of his songs have been translated into English by Longfellow, and a translation of some of his poems, with a memoir by A. Platt, has been published in England (London, 1848).

UHLICH, LEBERBOHT, a German rationalistic theologian, born in Köthen, Feb. 27, 1799. He studied theology at Halle, received an extraordinary professorship at Köthen in

1820, and became pastor of a church at Diebzig and afterward at Aix la Chapelle. Having incurred the enmity of the duke of Anhalt by a biography which he had written of his highness, he lost his employments and removed to Prussia, where he occupied himself in the labors of the ministry. In 1841 he established, with several associates of rationalistic tendencies, certain theological conferences out of which sprang the society of "Friends of Protestantism," with Uhlich as its president. The society was broken up by the Prussian government in 1845, and the president ordered to confine himself to his parish. He was soon after invited to Magdeburg as a preacher. His opinions on baptism here involved him in difficulties, and having been suspended by the consistory, he joined the free church of that city. He is a moderately voluminous writer.

UIGURS. See **TURKS**.

UKRAINE (Pol. *Ukraina*, border land), formerly the name of a S. E. province of independent Poland, extending on both sides of the Dnieper, and bordering on the territories occupied by the Tartars. Its limits frequently varied, its possession being contested by the Turks, Tartars, and Russians. In later times it was divided into Polish and Russian Ukraine. Since the first dismemberment of Poland it has entirely belonged to Russia, and the name is now generally used as identical with Little Russia, comprising the governments of Kiev, Tchernigov, Pultowa, and Kharkov. The country forms an extensive and for the most part exceedingly fertile plain, watered by the Dnieper and its lower affluents, and inhabited chiefly by Cossacks. (See **COSSACKS**.)

ULEMA (the Arabic plural of *alim*, wise), the collective name of the body of learned men in Turkey. In its strict sense the ulema comprehends the professors of law and divinity, the law as well as the religion of the Turks being grounded upon the Koran. The head of the ulema is the mufti; next to him come the cadileskiers, of whom there are two, one for Europe and one for Asia; the third class are the mollahs, who are the superior judges in the provinces; and after them are the cadis, who are the lowest officers of justice. The cadileskiers have a voice and vote in the divan, and all cadis are appointed by and subject to them. In a more enlarged sense, ulema comprehends beside these the religious teachers and officers.

ULFILAS, ULPHILAS, or WULFILAS, a Gothic bishop, born among the Goths in 311, died in Constantinople in 381. He belonged to a family of Christian Greeks of Cappadocia, whom the Goths had carried into captivity about 267. He was educated in the Gothic language, and in 341 became Arian bishop of those Goths who dwelt between the Danube and Mt. Hæmus. In 360 he was present at the Arian synod of Constantinople, and at the time of his death had gone thither to attend a disputation. He repeatedly led his people across the Danube into lower Mesia, and exercised a great and salu-

tary influence among them; but he is now chiefly remembered by his translation of the Scriptures into the Mosso-Gothic, which is the earliest specimen extant of the Teutonic language. This version included the Old and New Testaments, with the exception of the books of Kings. Before the translation could be made he was obliged to frame a new alphabet of 24 letters, 4 of which were invented by himself in order to express sounds unknown to Greek and Latin pronunciation. The version was in constant use by the various tribes of Goths so long as they preserved their nationality; but only a portion of it now exists. (See GOTHIC LANGUAGE AND LITERATURE.)

ULLMANN, KARL, a German theologian, born in Epfenbach in the Bavarian Palatinate, March 15, 1796. He studied philosophy and theology at the universities of Tübingen and Heidelberg, and in 1819 became *Privatdocent* of theology at the latter; in 1821 was promoted to an extraordinary professorship; and in 1829 he accepted a call as ordinary professor to Halle, but in 1836 returned to Heidelberg. In 1838 he was appointed by the grand duke of Baden "evangelical prelate" (bishop of the state church) and member of the supreme ecclesiastical council. This place he retained until 1860, when he resigned. His first important work was a monograph on Gregory of Nazianzus (Darmstadt, 1825). In 1828 he commenced with his colleague Umbreit the publication of the *Studien und Kritiken*, which counted among its contributors theologians like Schleiermacher, Lücke, Dorner, and Rothe, and established for itself the reputation of being one of the best theological quarterlies of Protestantism. The first article, contributed by Ullmann, "On the Sinlessness of Christ," is one of his chief productions. In 1830 he published against Hengstenberg, who had demanded the removal of two theological professors of Halle charged with rationalism, a memoir in defence of the liberty of teaching. A work on "Johann Wessel, a Predecessor of Luther" (Hamburg, 1834), was afterward enlarged by him and published under the title of *Reformatoren vor der Reformation* (3 vols., Hamburg, 1841-'2). The most important of his other works is *Ueber das Wesen des Christenthums* (4th ed., Hamburg, 1855). Several of the above named works have been translated into English.

ULLOA, ANTONIO DE, a Spanish mathematician and naval officer, born in Seville, Jan. 12, 1716, died in the Isla da Leon, near Cadiz, July 8, 1795. He was educated for the navy, became in 1738 a member of the royal marine guards, and in 1785 received the commission of lieutenant, and was sent to South America with the French academicians who were commissioned to measure a degree of the meridian at the equator. He labored strenuously to advance the geodetical operations, which were begun in June, 1786, near Quito, but was constantly called away from his scientific duties to assist in putting the coast in a state of defence against

Lord Anson's expedition. In Oct. 1744, he embarked for Europe in a French vessel, which was chased by an English privateer, and sought refuge in the harbor of Louisburg in Cape Breton; but as that city had lately fallen into the hands of the British, he was taken prisoner and carried to London, where his scientific friends obtained his liberty, and made him a member of the royal society. On his return to Spain in 1744 he was appointed to the command of a frigate, and created a commander of the order of Santiago. He immediately set about writing a history of the expedition, while the scientific portion of the report was written by his companion, Jorge Juan (4 vols., Madrid, 1748). After this he was employed by the Spanish court in making tours of observation in various countries of Europe, in 1755 went a second time to America, and after the peace of 1763, by which Louisiana was ceded by France to Spain, was made governor of that region. He arrived there in March, 1766, but found the inhabitants unwilling to submit to Spanish domination. The troops he brought with him were few, and he was compelled to govern the country through the French troops commanded by Aubry. Though he seems to have sincerely desired to conciliate the people, their discontent broke out into an open riot, in consequence of which he was obliged to leave the colony, in the government of which he was succeeded by O'Reilly. Returning to Europe, he published in 1772 a volume of essays on the natural history and antiquities of America, and in 1778 "The Marine, or the Naval Force of Europe and Africa," and "Observations of a Solar Eclipse made at Sea." He was now a lieutenant-general in the naval service, and was appointed to the command of a squadron intended to capture off the Azores an English merchant fleet heavily laden, and afterward to sail to Havana and join an expedition fitting out against Florida. Absorbed in his astronomical investigations, Ulloa forgot to open his sealed orders, and after cruising about for two months without success returned. He was tried in 1780 by a court martial demanded by himself, and, though acquitted, was never again allowed to engage in active service. He was one of the most munificent promoters of science and the arts in Spain, had a large share in establishing the observatory of Cadiz, encouraged woollen manufactures, and finished the havens of Ferrol and Carthagena. He was also the means of furnishing Spain with its first cabinet of natural history, and its first laboratory of experimental metallurgy.

ULM, a town of Württemberg, situated on the left bank of the Danube, on both sides of its tributary the Blau, and opposite the mouth of the Iller, 45 m. S. S. E. from Stuttgart, with which it is connected by railway; pop. in 1858, 21,858, exclusive of the garrison. The Danube here forms the boundary between Württemberg and Bavaria. The rivers are crossed by several bridges, one of which connects the

town with New Ulm, a village situated in Bavaria on the opposite side of the Danube. The cathedral of Ulm, built between 1877 and 1488, is a fine specimen of Gothic architecture and German art in the middle ages. It is 485 feet long, 200 feet broad, and 150 feet high, and the western tower 220 feet. It contains several valuable monuments and works of art, including stained glass windows, paintings, carved work, and a remarkably fine organ. There are several other churches, a museum, a library, many charitable institutions, a theatre, and a palace in which one of the princes of Württemberg resides. Linen goods, brass ware, leather, paper, &c., are manufactured.—Ulm was for many years an imperial free city, and its wealth became proverbial; but its prosperity has been much injured by its military importance, its possession having been contested in nearly all the great German wars. It surrendered to Napoleon, Oct. 17, 1805, when 24,000 Austrian troops under Gen. Mack were made prisoners. It is at present garrisoned by the troops of Württemberg, Bavaria, and Austria.

ULPIAN (DOMITIUS ULPIANUS), a Roman jurist, assassinated at Rome, A.D. 228. He was of Tyrian origin, and during the reigns of Septimius Severus and Caracalla was engaged in writing juristical works. When Elagabalus ascended the throne in 217 he was banished, but on the accession of Alexander Severus in 222 he became one of the chief advisers of that monarch, who made him *Scriniarum magister, consiliarius*, and *praefectus annonae*. He also held the office of praetorian prefect. He was killed by the soldiers in the presence of the emperor and his mother. Ulpian was one of the most distinguished of the Roman jurists, and from his works, which were very numerous, a much larger proportion of excerpts was taken by the compilers of the Digest in the time of Justinian than from any other legal writer.

ULRIOL, HERMANN, a German philosopher and critic, born in Pforten, Lower Lusatia, March 23, 1806. He was educated at Halle and Berlin, and practised law for a time, but after the death of his father in 1829 devoted himself to the study of history, poetry, and art. In 1834 he was made extraordinary professor in the university of Halle, which position he still holds. Among his works are: *Charakteristik der antiken Historiographie* (Berlin, 1838); *Geschichte der Hellenischen Dichtkunst* (2 vols., Berlin, 1835); *Ueber Shakspeare's dramatische Kunst* (Halle, 1839), in which he advances the idea that the object of the poet was the maintenance of a religious theory, Christian in its character with a Protestant tendency; *Ueber Princip und Methode der Hegel'schen Philosophie* (1841); *Das Grundprincip der Philosophie* (2 vols., Leipzig, 1845-'6), &c.

ULSTER, a S. E. co. of New York, bounded E. by the Hudson river, and drained by the Esopus, Rondout, and Wallkill creeks; area, 1,204 sq. m.; pop. in 1860, 76,879. The surface is broken by the Catskill and Shawan-

gunk ridges, and the soil is generally best adapted to grazing. The productions in 1855 were 20,185 bushels of wheat, 278,105 of oats, 242,239 of Indian corn, 70,676 of buckwheat, 134,589 of potatoes, 397,754 of apples, 64,795 tons of hay, and 1,669,681 lbs. of butter. There were 2 forges, 5 furnaces, 2 cotton and 4 woollen factories, 4 paper mills, 11 winter-green distilleries, 5 grist mills, 95 saw mills, 30 tanneries, 100 churches, 7 newspaper offices, and in 1858 25,556 pupils attending public schools. Iron ore, limestone, slate, and marl are found, and there are indications of the existence of coal, lead, plumbago, and alum. The Delaware and Hudson canal passes through the county. Capital, Kingston.

ULSTER, the northernmost of the four provinces of Ireland, bounded W. and N. by the Atlantic ocean, E. by the North channel and Irish sea, S. E. by the province of Leinster, and S. W. by that of Connaught, and comprised between lat. 53° 45' and 55° 25' N., and long. 5° 25' and 8° 50' W.; area, 8,527 sq. m.; pop. in 1861, 1,910,408, nearly $\frac{1}{4}$ Protestants. It is divided into the counties of Antrim, Armagh, Cavan, Donegal, Down, Fermanagh, Londonderry, Monaghan, and Tyrone. The coasts are generally rugged and indented by numerous fine bays and harbors, the chief of which are Carlingford bay, Dundrum bay, Strangford lough, Belfast lough, Lough Larne, Lough Foyle, Lough Swilly, Mulroy bay, Sheep Haven, and Donegal bay. The principal rivers are the Erne, Foyle, Bann, and Lagan. A considerable part of the surface is mountainous, and two chains traverse the province from E. to W., the highest peaks being in the counties of Donegal and Down; Erigal in the former and Slieve Donard in the latter are respectively 2,460 and 2,796 feet high. Between these ranges there is an extensive tract of undulating ground, near the central part of which is situated Lough Neagh. The other largest lakes are Upper and Lower Lough Erne, Loughs Melvin, Shulin, Oughter, Derg, Esk, and Veagh. Ulster is the seat of the Irish linen manufacture, and about $\frac{1}{4}$ of the population of the province derive subsistence from it. Cotton is extensively manufactured about Belfast. Internal communication is facilitated by means of several railways and canals, and numerous excellent roads.—Ulster was partly conquered and held as an earldom under Henry II. by John de Courcy, from whom it was transferred to Hugh de Lacy; and by descent from him, through the De Burgh and Mortimer families, the title was merged in the crown of England under Edward IV. Numerous insurrections having occurred, in the reign of James I. means were adopted for forming settlements of English and Scotch emigrants, called in history the plantation of Ulster. It was intended by confiscation to break up the power of the native chiefs and drive them and their followers into Connaught; but a few of the Irish were allowed to remain. The grantees were termed "un-

dertakers." Lots of 1,000 to 2,000 acres were conferred upon condition of their being settled by Scotch or English tenants; but the "Irish servitors" had the choice of taking either English or Irish tenants. Some of the trading companies and the corporation of the city of London obtained large grants, from which circumstance the prefix of London was placed before the town and county of Derry. A large proportion of the colonists were Scotch, and so many of their peculiarities have been transferred to the people of Ulster that in other parts of Ireland they are called Scotsmen.

ULTRAMARINE (Lat. *ultra*, beyond, and *marinus*, marine), a beautiful blue pigment, so named from the foreign sources from which it was originally obtained. It was formerly known only as a product of the mineral lapis lazuli, also called ultramarine. (See LAPIS LAZULI.) From the analysis of this mineral chemists were led to produce the same compound artificially, and its manufacture is now carried on upon a large scale in Germany. The substance is mainly a silicate of soda and alumina, containing the sulphurets of iron and sodium. According to one method, it is produced by grinding together equal parts of silica, sulphur, and carbonate of soda, by which a bluish green mass is obtained. This is ignited in the air, and various finishing processes are applied to the bluish powder. The product is extremely cheap compared with the real ultramarine, and is inferior to it as a pigment. The ordinary sorts are largely used in calico printing, color printing, and dyeing, in paper staining, and in the manufacture of sealing wax; and their use is rapidly increasing. The best artificial ultramarine, prepared only for the use of artists, is a much more expensive material, owing to the great number and variety of processes required in its manufacture.—The principal ultramarine factory is that of Messrs. Zeltner and Heyne at Nuremberg; the buildings are said to cover 7 acres; the central one has 24 sides, is 186 feet in diameter, and contains 96 furnaces. There are beside various mills with numerous steam engines, extensive washing apparatus, long ranges of drying rooms, and store rooms for 5,000 or 6,000 cwt. of artificial ultramarine. The works usually give employment to about 200 persons.

ULTRAMONTANISM (Lat. *ultra montes*, beyond the mountains), a name applied to that view of the papal prerogatives in the Roman Catholic church which claims for the pope the absolute right of issuing obligatory decrees on points of doctrine or ecclesiastical discipline, without being bound to the assent of oecumenical councils, national churches, bishops, or secular governments. The term originated in France, where those holding such views of the papal power were charged by their opponents with sacrificing the rights of the bishops, nations, and councils, and with placing the centre of Catholicism, to an undue extent, "beyond the mountains," at Rome. The ultramontane

system nowhere met with a greater resistance than in France, where in 1682 a national council of bishops opposed to it the liberties of the Gallican church. In Germany it was especially opposed by Febronius (Bishop Honthelm), and the convention of the archbishops of Mentz, Treves, Cologne, and Saltzburg, at Ems, in 1785. The secular governments endeavored to have the papal rights with regard to the Catholics of their countries determined by concordats or special conventions. The effort to secure by means of such conventions the largest possible extent of papal rights is also commonly designated as ultramontaniam.

ULYSSES, or ODYSSEUS (Gr. *Ὀδυσσεύς*), one of the most distinguished of the Greek leaders at the siege of Troy. According to the Homeric account, he was the son of Laertes and Anticlea, and married Penelope, the daughter of Icarus, by whom he had a son named Telemachus. Ruling in Ithaca, it was with great difficulty that he could be induced to join the expedition against Troy. According to one form of the legend, he simulated insanity to avoid taking part; but the shrewdness of Palamedes exposed the deception by placing in the furrow where Ulysses was ploughing his infant son Telemachus. The falsity of his madness being thus disclosed, he joined the Grecian fleet at Aulis with 12 ships, and when the expedition had reached Tenedos was sent with Menelaus to Troy to demand Helen and the stolen property. The mission was unsuccessful. In the 10 years' war he was distinguished for his prowess as a warrior, but far more for his eloquence, sagacity, and inexhaustible resources under difficulties. After the death of Achilles his armor was offered as a prize to the greatest warrior in the Greek army, and Ulysses and Ajax became rivals for the honor, the former proving successful. By his contrivance the Palladium was carried away from Troy by stealth, and he was one of the heroes concealed in the wooden horse which the Trojans incautiously introduced into the city. His 10 years' wanderings after the close of the siege, which form the subject of the *Odyssey*, are still more celebrated. After various adventures he was thrown upon the coasts of the Lotophagi, where his companions, having eaten of the lotus, wished to remain. He however succeeded in inducing them to depart, sailed to the island of the Cyclops, and with 12 of his followers entered the cave of Polyphemus, who devoured 6 of his companions. In order to save himself and the rest, Ulysses, managing to make the giant drunk with wine, put out his one eye with a burning pole, and then tying himself and his companions under the bodies of the sheep, when these were let out of the cave they were carried out with them. Polyphemus implored his father Neptune to visit Ulysses with his vengeance, and the remainder of his voyage was constantly disturbed by the enmity of the god of the sea. Reaching the island of Eolus, Ulysses was presented by that deity on his de-

parture with a bag containing the winds that were to bring him home; but his followers opened the bag without his knowledge, the winds escaped, and the vessels were driven back to the island, where the angry Æolus refused any further assistance. After 6 days he reached the country of the cannibal Læstrygonæ, from which he escaped with only one ship. Thence he sailed to Æsæa, inhabited by the sorceress Circe, who changed part of his followers into swine. Through the aid of Mercury he was enabled to overcome her spells, and his companions resumed their human shape. Circe now treated them kindly, and by her advice Ulysses descended into Hades to consult the seer Tiresias. The prophet assured him that every thing would yet turn out right if the herds of Helios in Trinacria should be left unharmed. Returning to Æsæa, he was carried to the island of the sirens, but by filling the ears of his companions with wax and tying himself to the mast he passed them in safety. Going between Scylla and Charybdis, the former devoured 6 of his followers. Coming to Trinacria, he was compelled by his companions, much against his will, to land. There they were detained by storms, and while he was sleeping some of the finest of the cattle of Helios, which they had sworn not to touch, were killed and eaten by his followers. As soon as they were again on the open sea, another storm arose, and the vessel was destroyed by Jupiter with a stroke of lightning, all on board being drowned with the exception of Ulysses. He was carried to the island of Ogygia, inhabited by the nymph Calypso, who promised him immortality and eternal youth if he would marry and remain with her. But he longed to revisit his native land, and after a stay of 8 years embarked on a raft, and reached Scheria, from which place he was sent to Ithaca in a ship, having been absent 20 years. He found his wife beset by suitors (see PENELOPE), made his appearance first as a swineherd, and then disclosed himself to his son Telemachus, and by the assistance of the goddess Minerva, whose special favorite he was, succeeded in killing the suitors and the faithless servants. Of the latter years of his life and of the manner of his death there are different accounts. In one, his son Telegonus by Circe, being sent to look for his father, and being shipwrecked on Ithaca and beginning to plunder for the sake of obtaining food, was attacked by Ulysses and Telemachus, and in the contest that followed Telegonus slew his own father.

UMBER. See PAINA, vol. xii. p. 678.

UMBRE, a wading bird of the heron family, and genus *scopus* (Briss.). The bill is longer than the head, elevated at the base, compressed laterally, keeled above and below, and a little bent at the point; the nostrils prolonged in a furrow; 8d and 4th quills equal and longest; tail short and even; tarsi longer than middle toe and scaled; front toes united by membrane to first phalanx, the hind one resting wholly on

the ground; claws short and slightly curved. The only described species, the tufted umbre (*S. umbretta*, Gmel.), is 20 inches long, with a bill of 8½; the color is a uniform umber brown, the wings and tail barred with darker; the male has an occipital crest about 4 inches long, of loose feathers. It is a native of Africa, but its habits are not well ascertained.

UMBREIT, FRIEDRICH WILHELM KARL, a German Protestant theologian, born at Sonneborn, Gotha, April 11, 1795, died in Heidelberg, June 11, 1860. He studied theology and the oriental languages at the university of Göttingen, especially under Eichhorn, and made himself favorably known as early as 1816 by a prize essay, *Commentatio Historiam Emirorum-al-Omrah ex Abulfeda exhibens* (Göttingen, 1816). He became in 1818 *Privatdozent* at the university of Göttingen, in 1823 ordinary professor of philosophy, and in 1829 ordinary professor of theology. He is the author of a number of valuable exegetical works on the Old Testament, in which he endeavored to blend a strictly philological mode of interpretation with the theological and æsthetic. His works of this class are: *Lied der Liebe* (Göttingen, 1820); *Übersetzung und Auslegung des Buches Hiob* (Heidelberg, 1824); *Commentar über die Sprüche Salomos* (Heidelberg, 1826); *Christliche Erbauung aus dem Psalter* (Hamburg, 1835); *Grundriss des Alten Testaments* (Heidelberg, 1848); and *Commentar über die Propheten des Alten Testaments* (4 vols., Hamburg, 1841-'6), his principal work. He was also, with his friend Dr. Ullmann, editor of the *Studien und Kritiken*, the principal theological quarterly of Protestant Germany.

UMBRELLA (Lat. *umbella*, a little shadow, an umbrella, from *umbra*, a shade), a folding shade or screen carried over the head, as a protection from the rain or the sun. When of small size and used by ladies only as a sunshade, it is called a parasol (Ital. *parare*, to ward off, and *sola*, the sun). The French call what we term umbrella *parapluie*, thus designating its use as a defence against rain. Umbrellas are made of a light jointed frame covered with silk, cotton, or alpaca, which can be expanded at pleasure or brought down snugly around the central stick. This stick is the foundation of the frame, and is furnished at its lower end with a proper handle for supporting it, and at the upper end with a metallic ring around which are hinged the upper ends of the light ribs, most commonly of whalebone, to which a cover is attached. Near the middle of each rib is hinged a slender metallic rod or stretcher, the lower ends of which all meet in a ring that slides from the handle up sufficiently far to spread out the ribs to the required extent. Modern improvements in umbrellas consist in the use of steel for the ribs, and of superior kinds of iron, japanned to protect it from rust, for the stretchers, and in the perfection of the joints. A substitute for whalebone in the ribs of umbrellas has recently been introduced in

England, in strips of second growth white oak, selected from butts not more than 6 feet from the ground. When perfectly straight and free from knots and curls, the wood is made, by a proper method of curing, superior to whalebone in tenacity and in resuming a straight condition after being bent and exposed to the weather. For the ribs of cheap umbrellas rattan is largely used. Vulcanized India rubber has been employed for all portions of the frame. Advantage has also been taken of the combined strength and lightness of hollow tubes to apply this principle to the sticks, ribs, and stretchers of umbrellas; and for making them more portable, the handles have been formed of tubes sliding one within another like a telescope, while the ribs formed of steel are furnished with a folding hinge or joint.—Umbrellas were used in eastern countries in ancient times, and were originally designed for sunshades only. They are seen represented upon old chinaware, and are figured upon ancient carvings at Persepolis. Niebuhr describes the princes of southern Arabia as returning from a mosque preceded by a retinue of soldiers, and with attendants at the side of each carrying a large umbrella. Those used by the Chinese, Japanese, and Siamese are made with a light frame of bamboo and covered with oiled and varnished paper, and differ from ours in presenting a surface nearly flat instead of sloping when spread out. The umbrellas of the Siamese kings are said to be made with several separate circles, one above another, while others are only permitted to use them with a single circle. Some of those used by eastern dignitaries are so large as to require several persons to carry them. The ancient Greeks and Romans had umbrellas, which appear from the paintings on vases to have been very much like those of the present time; they were used chiefly as a protection against the sun, and by ladies only. Among the Greeks it was customary for female slaves to carry the parasol over the heads of the ladies; and among the Romans parasols were common presents to ladies, and to hold them over their heads was one of the common attentions of lovers. Umbrellas were introduced into Europe at a comparatively recent period, and it is not yet 100 years that they have been in general use in England. Jonas Hanway, the philanthropist, is said to have been the first man who commonly carried one in the streets, and this at a time when their use was considered a mark of great effeminacy. They were at first kept only in the halls of houses of the first class, and were used for holding over persons as they stepped to their carriages.—In the United States the manufacture of umbrellas is in many places an important branch of industry. In Philadelphia it is said to employ directly about 1,500 persons, and the annual product of the sales is from \$1,000,000 to \$1,500,000. Machinery of a novel design has been applied to the production of some of the parts, and, as

in the manufacture of guns, each piece is made with mathematical accuracy, and with such advantage that in one of the establishments (that of Wright brothers and co.) as many as 2,200 umbrellas and parasols are produced daily by the labor of only 450 hands. The annual consumption of silks and cottons for covering these is said to be full 1,000,000 yards, of rattan 200,000 lbs., of whalebone over 100,000 lbs., and of horn, bone, ivory, and other materials for ornamental mountings, about 75 tons. In Frankford, near Philadelphia, are establishments devoted to the manufacture of new mountings, tips, &c. The handles are also produced in the separate works of the ivory and bone turners and carvers; and the carvings are equal to any of the same kind of work done in Europe.

UMBRELLA (Lam.), a genus of gastropod mollusks, so called from the resemblance of the flattened shell to an umbrella. The animal has a very large tuberculated foot, deeply notched in front; the shell is small, merely covering the most important organs. The *U. umbellata* (Lam.), the Chinese umbrella shell, is a native of the Indian ocean.

UMBRELLA BIRD, the popular name of a singular South American bird, placed by the latest authors among the chattering (*campylidæ*), sub-family *gymnoderina* or fruit birds, and genus *cephalopterus* (Geoffr.). The bill is stout, long, flattened, gradually curved, with the tip notched and slightly hooked; wings moderate, rather pointed, with the 3d quill longest; tail short and rounded; toes long and slender, with curved claws. The *C. ornatus* (Geoffr.) is about as large as a crow, glossy black, with violet, blue, and metallic reflections on the crest and pectoral appendage. The head of the male is surmounted by a large crest of 50 to 80 feathers springing from over the nostrils, the lower half a white stiff shaft, and terminating each in a tuft of black hair-like feathers spreading in all directions, but principally forward; it arises from a contractile skin on the top of the head, and when erected almost hides the bill from view; it is 5 inches in length and about 4½ wide, somewhat resembling a beautiful blue umbrella, whence the above name. The skin of the neck is very loose, and from it grows a cylindrical fleshy process, about as thick as a goose quill, 1½ inches long, from which extends a tuft of imbricated feathers bordered with metallic blue, and hanging down several inches. It is found in the islands of the great South American rivers, feeding principally on fruits, ejecting the stones when present from the mouth; it is arboreal in habit, and utters a very loud and deep note, which has gained for it from the tribes of the Rio Negro the name of piper bird.—The arapunga or bell bird (*procnia alba*, Thunb.) is about 12 inches long and pure white; it has a singular cylindrical fleshy appendage, with a few small feathers, arising from the base of the bill; the mouth is very wide, enabling it to swallow large ber-

ries and fruits; the voice resembles the tolling of a bell, and may be heard, according to Warton, nearly 8 miles, and during the heat of the day, when most other birds are silent; it is a native of the forests of tropical South America.

UMBRIA, a country of ancient Italy, bounded N. by Cisalpine Gaul, E. and S. by the Adriatic, Picenum, and the territory of the Sabines, and W. by the Tiber, separating it from Etruria. Its principal cities were Ariminum (now Rimini), Pisaurum (Pesaro), Fanum Fortunæ (Fano), Mevania (Bevagna), Tuder (Todi), Narnia (Narni), and Spolegium (Spoleto). Its W. part was occupied by the Apennines; the E. stretched out toward the coast in fertile plains. Beside the Tiber, the principal rivers were the Rubicon, Ariminus (Marecchia), Pisanus (Foglia), Metaurus (Metauro), and Æsis (Esino), all flowing into the Adriatic, and the Nar (Nera), an affluent of the Tiber. The inhabitants, the Umbri, were one of the most ancient races of the peninsula, and at an early period became the most powerful people of central Italy. Etruria was originally in their possession. The Romans overcame them in 307 B. C.—The name Umbria has been revived in modern times to designate a portion of what was recently the Papal States, comprised chiefly in the delegations of Spoleto and Perugia.

UMPQUA, a W. co. of Oregon, bounded W. by the Pacific ocean and drained by the Umpqua and Kowas rivers; area over 1,500 sq. m.; pop. in 1860, 1,250. The surface is hilly or undulating, and the soil is very fertile, producing wheat, Indian corn, rye, oats, and other grains in great abundance. Capital, Umpqua City.

UMRITSIR. See AMRITSER.

UNAU. See SLOTH.

UNCA, a North American Indian, sachem of the Mohegan tribe in Connecticut, died about 1680, at a great age. He was originally a war chief of the Pequot nation, but in 1684 revolted from the Pequot sachem Sassacus, obtained the support of the English settlers, and so acquired dominion over the Mohegan territory. In May, 1687, he joined the English in the war against the Pequots, and proved a valuable auxiliary, receiving for his services another portion of the Pequot lands. Many of the Pequots were shielded by him from the vengeance of the English when the war was over, and for this he was for a time in partial disgrace with the authorities; but he was soon received again into so great favor with the whites that several attempts were made by different Indians to assassinate him. There was then in existence an agreement to refer all quarrels to the English. Uncas accordingly complained to them, and they joined him in a war that ended in the death of the powerful Narraganset sachem Miantonomoh, at whose instigation it was thought the attempts had been made. In 1648 the Mohawks, Pocumtucks, and other tribes made war against Uncas with but little success.

He was besieged in 1657 in his stronghold on the Connecticut by the Narraganset chief Peasacus, and nearly starved out; but he was relieved at almost the last moment by Ensign Leffingwell, who took in to him at night a canoe laden with supplies. For this act it is said that Uncas gave to Leffingwell a deed for all the land upon which the town of Norwich now stands, though that chief afterward sold it to a company. A council of commissioners of the united colonies, held at Boston in 1654, heard a great many complaints of the rapacity and injustice of Uncas, and ordered that he "be duly reprov'd, and seriously informed that the English cannot own or protect him in any unlawful, much less treacherous and outrageous courses." He was characterized in 1674 as "an old and wicked, wilful man, a drunkard, and otherwise very vicious; who hath always been an opposer and underminer of praying to God." He was the ally of the English in all the wars against the Indians during his life, though in King Philip's war he was too old to be of much active service.

UNGUIOLATA, and UNGULATA, terms originally applied by Ray to mammals, according as they possessed claws or hoofs, though Aristotle, centuries before, had made a similar division of quadrupeds, placing among unguiculates the monkeys, bats, carnivora, and rodents, and among the ungulates the pachyderms, ruminants, and solipeds (horse). Ray placed among unguiculates the camel, elephant, and edentates, as well as those above mentioned; Linnaeus followed Ray in his division of quadrupeds. This system has been variously modified by Cuvier, Swainson, Oken, C. L. Bonaparte, and Owen, the last restricting the unguiculates to the monkeys and carnivora, and the ungulates to the omnivora, ruminants, solipeds, and pachyderms. (See MAMMALIA, vol. xi. p. 125.)

UNICORN, a fabulous animal resembling a horse, with a single horn issuing from the middle of the forehead, well known as the animal which with the lion supports the coat of arms of England. The unicorn of the Bible was undoubtedly the rhinoceros; the sea unicorn is the narwhal. In Smith's "Illustrations of the Zoology of South Africa," under *rhinoceros keilou*, is an allusion to *ndeco-doo*, probably a species of rhinoceros, described as about the size of a horse, very fleet, strong, and fierce, with a single horn projecting from the forehead, which comes near the usual figures of the unicorn of fable; it is met with near the tropic of Capricorn and in the country to the north of Mozambique. According to Van Zach, there is in N. Africa a ruminant of the antelope family, with a single long and straight horn upon the forehead; this may be the rhinoceros above referred to, or it may be a mutilated or entirely imaginary animal.

UNIOLA, a genus of North American grasses found on the sea coast from Long island, N. Y., to Virginia and southward. They have tough perennial roots, from the creeping rootstocks

of which issue tall erect culms, with flat, lanceolate, broad leaves, and broad, many-flowered spikelets of closely appressed flowers. The broad-leaved uniola (*U. latifolia*, Mx.) is an elegant plant with culms 2 to 3 feet high, the spikelets of a pleasing green color, oblong, acute, with 10 to 15 flowers. It is found on fertile hillsides and banks of rivers from southern Pennsylvania to Kansas and southward. It is well suited to the garden, especially if the soil is light and sandy, and easily propagates from seeds or division of its roots. The panicked uniola (*U. paniculata*, Linn.) has stout culms 8 to 5 feet high, very long rigid leaves, becoming soon convolute, crowded, drooping panicles, and is a conspicuous plant, occurring in the drifting sands on the sea coasts from southern Virginia to Florida. The graceful uniola (*U. gracilis*, Mx.) has smaller, contracted, and wand-like panicles, with appressed branches broadly wedge-shaped, and with 4 to 8 flowers, the culms 3 feet in height; it is found on the coast from Long Island southward. A species with smooth linear leaves and slender culms, 1 to 2 feet high (*U. nitida*, Baldwin), occurs in swamps of Georgia and Florida; and another species (*U. distichophylla*) is described by Labillardiere as indigenous to New Holland. The uniolas possess no agricultural value, but are grasses of extraordinary beauty.

UNION, the name of counties in 18 of the United States. I. A N. E. co. of N. J., bounded N. E. by Passaic river, E. by Staten Island sound and Newark bay, and S. by Rahway river, and drained by Elizabeth river and several small streams; area, 101 sq. m.; pop. in 1860, 27,781. The surface is nearly level, and the soil generally fertile. The productions in 1860 were 10,084 bushels of wheat, 14,698 of rye, 191,980 of Indian corn, 100,507 of oats, 55,225 of potatoes, 280,145 lbs. of butter, and 12,128 tons of hay. There were 44 carriage factories, 11 clothing factories, and altogether 181 manufacturing establishments with a capital of \$2,921,739; 50 churches, 6 newspaper offices, and 4,599 pupils attending public schools. It is intersected by the New Jersey and the New Jersey central railroads. It was formed out of part of Essex co. in 1858. Capital, Elizabeth. II. A central co. of Penn., bounded E. by the Susquehanna river and its West branch, and drained by Penn's, Buffalo, White Deer, and Middle creeks; area, about 250 sq. m.; pop. in 1860, 14,145. The surface is mountainous, the Buffalo, Nittany, and other mountains belonging to the Alleghany range traversing a large part of the county; the soil along the streams is very rich. Iron ore, bituminous coal, and limestone abound. There are several iron furnaces and foundries, 2 newspaper offices, and in 1860 there were 3,778 pupils attending public schools. Snyder co. was formed out of the south half of Union in 1855. The North Branch canal passes along the E. border. Capital, New Berlin. III. A S. co. of N. C., bordering W. and S. on S. C.,

drained by Warsaw and Richardson creeks; area, about 350 sq. m.; pop. in 1860, 11,362, of whom 2,246 were slaves. The surface is generally hilly and the soil in some parts fertile. The productions in 1860 were 52,854 bushels of wheat, 39,875 of Indian corn, and 2,264 bales of cotton. There were 23 churches, and 1,088 pupils attending public schools. Granite and slate abound, and excellent sand for hones and whetstones is found. Gold mines of some value have been worked. Capital, Monroe. IV. A N. district of S. C., bounded E. by Broad river and S. by the Ennoree, and intersected by the Pacolet and Tyger rivers; area, 500 sq. m.; pop. in 1860, 19,635, of whom 10,801 were slaves. The surface is hilly and the soil fertile. The productions in 1860 were 655,078 bushels of Indian corn, 68,896 of wheat, 99,739 of oats, 47,127 of sweet potatoes, and 14,156 bales of cotton. There were 25 grist mills, 18 saw mills, 8 tanneries, an iron foundry, 40 churches, and 295 pupils attending public schools. Iron ore and granite abound, and there is one valuable gold mine. It is intersected by the Spartanburg and Union railroad. Capital, Unionville. V. A N. co. of Ga., bordering on N. C., and drained by the head streams of the Hiwassee and Tocco rivers; area, 630 sq. m.; pop. in 1860, 4,413, of whom 116 were slaves. The surface is mountainous, being traversed by the Blue ridge. The highlands are well adapted to pasturage. The productions in 1860 were 274,345 bushels of Indian corn, 40,428 of oats, and 30,967 of sweet potatoes. There were 2 tanneries, 1 forge, 12 churches, and 275 pupils attending public schools. Iron, marble, and granite are found, and there are profitable gold mines. Capital, Blairsville. VI. A N. parish of La., bordering on Ark., bounded E. by the Washita river and intersected by its affluents the D'Arbonne and Lutre bayous; area, about 1,000 sq. m.; pop. in 1860, 10,890, of whom 3,745 were slaves. The surface is moderately hilly and the soil sandy and fertile. The productions in 1860 were 292,095 bushels of Indian corn, 105,290 of sweet potatoes, and 5,913 bales of cotton. There were 11 churches, and 514 pupils attending public schools. The Washita and D'Arbonne are navigable for steamboats. Capital, Farmersville. VII. A S. co. of Ark., bordering on La., bounded N. W. by the Washita river, and drained by several of its tributaries; area, about 1,230 sq. m.; pop. in 1860, 10,293, of whom 1,331 were slaves. The surface is hilly and the soil fertile. The productions in 1860 were 341,406 bushels of Indian corn, 32,660 of sweet potatoes, 7,087 bales of cotton, and 22,861 lbs. of butter. Capital, El Dorado. VIII. A new N. E. co. of Tenn., intersected by Olinch river, and bounded N. by its N. fork; area, about 400 sq. m.; pop. in 1860, 4,117, of whom 182 were slaves. The surface in the N. and centre is mountainous, and in other parts hilly, and the soil adapted to grazing. Wheat, Indian corn, and tobacco are produced.

and iron ore and bituminous coal are found. Capital, Maynardsville. IX. A N. W. co. of Ohio, separated from Indiana and Illinois by the Ohio river, and drained by Tradewater and Highland creeks; area, 850 sq. m.; pop. in 1860, 12,791, of whom 3,105 were slaves. The surface is undulating or hilly and the soil fertile. The productions in 1850 were 680,640 bushels of Indian corn, 11,994 of wheat, 50,045 of oats, and 494,784 lbs. of tobacco. There were 18 churches, and 1,284 pupils attending public schools. Bituminous coal is abundant, and there are several sulphur and chalybeate springs. Capital, Morganfield. X. A central co. of Ohio, drained by affluents of the Scioto river; area, 445 sq. m.; pop. in 1860, 16,507. The surface is level and the soil fertile. The productions in 1850 were 624,898 bushels of Indian corn, 26,563 of wheat, 88,274 of oats, 47,407 lbs. of butter, 210,840 of cheese, 62,283 of wool, and 16,969 tons of hay. There were 6 churches, and 3,279 pupils attending public schools. It is intersected by the Bellefontaine, Terre Haute, and St. Louis, and the Springfield, Mt. Vernon, and Pittsburg railroads. Capital, Marysville. XI. A S. E. co. of Ind., bordering on Ohio, drained by the East fork of White-water river; area, 168 sq. m.; pop. in 1860, 11,110. The surface is generally undulating and the soil very fertile. The productions in 1850 were 681,515 bushels of Indian corn, 8,862 of wheat, 52,980 of oats, 204,269 lbs. of butter, and 3,665 tons of hay. There were 27 churches, and 1,828 pupils attending public schools. Capital, Liberty. XII. A S. co. of Ill., bounded W. by the Mississippi and drained by Clear creek; area, 320 sq. m.; pop. in 1860, 11,182. The surface is undulating and the soil fertile. The productions in 1850 were 814,705 bushels of Indian corn, 81,902 of wheat, and 12,349 of oats. There were 27 churches, and 1,300 pupils attending public schools. Iron ore, lead, chalk, bituminous coal, porcelain clay, alum, and copperas are found. It is intersected by the Illinois central railroad. Capital, Jonesborough. XIII. A S. W. co. of Iowa, drained by the head waters of the Platte and Grand rivers; area, 482 sq. m.; pop. in 1860, 2,012. The surface is level or undulating, and the soil fertile. The productions in 1859 were 3,498 bushels of wheat, 65,608 of Indian corn, 1,964 tons of hay, and 86,274 lbs. of butter. The line of the projected Burlington and Missouri railroad passes through the county. Capital, Afton.

UNION COLLEGE, a seat of learning at Schenectady, N. Y. In 1779 the inhabitants of the region lying N. of the Mohawk river petitioned the legislature for the incorporation of a college, but without success. In 1782 and in 1791 the petition was renewed, but again failed. In 1793 the Schenectady academy was incorporated. In 1794 an effort was made to obtain an endowment for a college by subscription, and \$7,985 was contributed by 99 persons in Albany, and \$3,425 by 231 persons in Sche-

nectady. This sum was afterward largely increased by further subscriptions, and through the influence of Gen. Philip Schuyler, who had been a liberal contributor, the location was fixed at Schenectady. On Feb. 25, 1795, the regents of the university incorporated it. It received its name from the coöperation of several religious denominations in its organization. The first president was John Blair Smith, D.D., who on his election resigned the pastorate of the third Presbyterian church in Philadelphia, but in 1799 returned to his former charge, and died a few months later. He was succeeded by Jonathan Edwards the younger, who, at the time of his election in May, 1799, was pastor of a Congregational church in Colebrook, Conn. He died in Aug. 1801, and in 1802 the Rev. Jonathan Maxcy, D.D., then president of Brown university, was chosen to succeed him, but after two years resigned to accept the presidency of the South Carolina college. In 1804 Eliphalet Nott, D.D., then pastor of a Presbyterian church in Albany, was elected to the presidency of the college, and still holds the office (May, 1862). At President Nott's accession the college was but slenderly endowed and had but a small number of students. The college building (there was then only one) was in the city. Application was made to the legislature for aid, and in 1805, and subsequently in 1814 and 1822, lotteries were authorized, the net proceeds of which were to go to the endowment of the college. The fund thus raised, together with some subscriptions and donations, permanently invested, amounted in 1822 to \$331,612.18. The proceeds of the last lottery were involved with private property of Dr. Nott, who managed the whole, and in process of time the accounts had become so much complicated, that it required many months and the skill of eminent accountants to ascertain the rights of the two parties. These having been determined, Dr. Nott, by papers executed Dec. 28, 1855, made over to trustees for the college a large sum, estimated at several hundred thousand dollars. The building first erected in Schenectady proving inadequate for the wants of the college, a tract of land was purchased in 1814 on an eminence E. of the city, and two buildings were erected. To these have since been added buildings for library, cabinet, and lecture rooms, and a fine central chapel, begun in 1858. The building in the city was sold to the municipal authorities for the use of the public schools. In 1855 the college was partially reorganized, and departments of civil engineering and analytical chemistry established, which are amply provided with facilities for instruction. Mr. E. O. Delavan has presented to the college a fine cabinet of minerals and shells, known as the "Wheatley collection," purchased for the institution at a cost of \$10,000. The faculty now consists of the president, vice-president, 12 professors, 1 lecturer, and 8 tutors. There are about 320 students. The whole number of

alumni in 1860 was 8,657, of whom 1,800 were clergymen; and the number of volumes in the college libraries was about 16,000.

UNITARIANISM, the general name since the reformation for that class of opinions which grew up in opposition to the doctrine of the Trinity, rejecting the threefold distinction of personality in the Divine Being, and asserting the absolute unity of God. These opinions appeared simultaneously with the earliest speculations on the Logos, and, though uniformly pronounced heretical by the church, kept even pace with those speculations through all the successive periods of its history. Toward the end of the 2d century we find them associated with the names of Theodotus, a Byzantine leather-dresser, who came to Rome and gathered there a small company of disciples, and Artemon, who also taught in Rome, and whose school maintained for about 100 years its attitude of sharp rationalistic antagonism to the church dogma. Both of these men asserted the simple humanity of Christ, contending that he was no more than a divinely illuminated prophet. Theodotus was excommunicated, not probably for his opinions alone, which Artemon insisted were the current opinions till after his day. Substantially the same views were held about the same time by Beryllus, bishop of Bostra in Arabia. He found an opponent in Origen, and was, it is said, induced to retract his doctrine. Nearly contemporaneous with Theodotus and Artemon, Praxeas came to Rome from Asia Minor and taught under a new form the indivisible unity of the Godhead. The school of Artemon represented Christ as man in the similitude of God; Praxeas represented him as God in the similitude of man, the humanity being only a mask. His fame as a brave confessor shielded Praxeas from suspicion, and gave considerable currency to his views until Tertullian brought down upon them his fiery polemics. In connection with Praxeas, as holding essentially the same opinions of Christ, the name of Noëtus is recorded as teaching in Smyrna. In him we have the germs of the doctrine afterward developed by Sabellius in the middle of the 3d century, a doctrine which saved the divinity of the Son by destroying not only his humanity, but his personality as a member of the Trinity. Arianism (see *ARIUS*) originated in the 4th century, in a private discussion between Arius, a presbyter of Alexandria, and the bishop Alexander, the latter maintaining the essential equality of the Son and the Father, and the former throwing on the bishop the reproach of Sabellianism, and asserting that there was a time when the Son was not—thus denying the Son's eternity, making his generation dependent on the will of God, and assigning to him a position subordinate to the Supreme, though solitary and unapproachable by any other created being. This doctrine became the parent of the later Socinianism, and through that the direct progenitor of the Unitarianism of a still later day.—At the time of the reformation Unitarian-

ism was one of the earliest developed forms of religious opinion. In Germany Ludwig Hetzer and Johann Denck promulgated it in a rationalistic form, associating the belief that Christ was an illuminated teacher and a perfect human example, with the doctrine of the inner light, and the persuasion that all spirits, even those of devils, would at last be brought into blessedness. In Swabia, Sebastian Frank the mystic appealed to the interior Word which judged the letter of Scripture, and to the interior Christ of whom the historical Christ was only the symbol and sign. Through Switzerland, Claudius of Savoy taught the Hebrew monotheism and the simple humanity of Jesus. In the 16th century Unitarian doctrines of a radical stamp were openly and freely disseminated in Saxony and Holland, in connection generally with Anabaptist opinions. In Italy, long before the reformation, there existed an indefinite amount of dissent from the orthodox Trinitarian faith. The reformation brought the heresies to light only to show how extensive they were, and to occasion their immediate expulsion from the country. Fugitive Unitarians in considerable numbers found refuge in Switzerland. Hither came from Venice Laëlius Socinus, who settled in Zürich about 4 years before the burning of Servetus in Geneva. At that date he was travelling in Italy, but on his return he occupied himself with theological speculations, his caution and probably the indistinctness of his views saving him from persecution, though not from suspicion, on the part of Calvin and other leaders of the Trinitarian party. At Zürich Bernardino Ochino, an intimate associate of Socinus, published in 1563 the dialogues in which the doctrine of the Trinity, and indeed every other cardinal doctrine, was submitted to severe examination. Matteo Gibaldi and Giorgio Blandrata of Saluzzo taught in and about Geneva that the Father and the Son were two distinct persons, the first divine in essence, the second having a derived divinity. Calvin was obliged to use his authority to stop the increasing heresy. Blandrata withdrew to Zürich; other teachers left Switzerland for Poland. A few years later Giovanni Valentino Gentilis, a Calabrian, was beheaded at Bern for false doctrine and blasphemy, his opinions being similar to those which the Spaniard Servetus had disseminated so widely through Switzerland, Germany, and France. Poland was now the refuge of the Unitarian believers. A printing establishment at Racow issued writings of Faustus Socinus about the middle of the 16th century. The nobility, a powerful, rich, and independent class, all but sovereign on their own estates, encouraged the principles of the reformation in their most radical form. The exiles from Italy and Switzerland made Pinczow their head-quarters, and were known as Pinczovians. For 10 years they freely pursued their inquiries within the pale of the reformed church. Gonesius wrote boldly against the Trinity. Blandrata would use none but

Scripture language in speaking of God and Christ. Stancar taught that Christ mediated as man only. Gregory Pauli openly denied his preëxistence. Statorius contended that the Holy Ghost was the power of God's grace in the soul. The Unitarians were called *ecclesia minor*; but they were hardly more than an unorganized band of dissenters till F. Socinus came among them and elaborated the system which has since borne his name. Socinus spent several years in Oracow, and left it only when residence there became insecure. With Sigismund III. the dark days of Unitarianism came in. The Jesuits were recalled to the kingdom; the offices of dignity and emolument were given to the Roman Catholics; the popplace was instigated to acts of violence against dissenters; and Socinus narrowly escaped death at the hands of a mob. In 1627 the church in Lublin was broken up; in 1688 a decree was passed devoting to destruction the famous school at Racow, which, under the patronage of Socinian nobles, had been called the Athens of Sarmatia. The outcasts from Racow fled to Kiscoclin; but that place was also doomed. From the colloquy of Thorn the Unitarians alone were excluded. A decree of John Casimir forbade the profession of Arianism on pain of death. Under the pressure of this decree, which was to take effect at the expiration of two years, some of the Unitarians abandoned their faith, and others abandoned their country and went to Transylvania, Germany, Silesia, Prussia, and the Netherlands. Pursued by authority, hated by the people for their opinions, divided among themselves, they dragged on a painful existence till the end of the century, and then as a body disappeared from all other countries of Europe but Transylvania.—In the English mind Unitarian opinions took root at a very early period of the reformation. In the reign of Edward VI., George Van Paris was burned at Smithfield for denying the proper divinity of Christ. Francis Wright was burned at Norwich in 1588 for similar opinions. The fires were lighted again in Smithfield 24 years later to burn Arianism in the body of Bartholomew Legate. The same year (1612) Edward Wightman suffered at the stake in Lichfield for the rather inconsistent heresies of Ebionitism and Arianism, his judges probably not understanding the distinction, but deeming either fair cause for burning. Among the humbler classes many denied the Godhead of Christ, some asserting his simple humanity, others claiming for him an angelic nature. At a later period, encouraged by the free thought of the age and by foreign influences, chiefly from Holland, the doctrines of the continental Anti-Trinitarians prevailed extensively. The synods of London and York found Socinianism formidable enough in 1640 for the direction of a special canon against it. The poet Suckling allotted to it a separate chapter in his "Account of Religion by Reason." Under the long parliament the doctrine was openly preached in

London that Christ was not God. Nye told some divines of the assembly that "to his knowledge the denying of the divinity of Christ was a growing opinion;" and Dr. Owen in 1655 wrote: "There is not a city, a town, scarce a village in England wherein some of this poison is not poured forth." In April, 1652, copies of the Racovian catechism were burned in London, an indication of the connection between Polish Socinianism and English Unitarianism. The first apostle of Unitarianism in England was John Biddle, of Magdalen hall, Oxford. He gathered a congregation in London, published two catechisms setting forth a rude and crude scriptural theology, and is said to have translated the Racovian catechism into English. Biddle had great scorn for "the brain-sick notions which were first hatched in the brains of Platonists to pervert the worship of the true God," and was zealous in opposing them to a degree that brought on him serious persecution. The council of state directed Dr. Owen to refute Biddle's views. Socinian opinions were very prevalent in the church, even more than out of it, some said. In 1705 we hear of "troops of Unitarian and Socinian writers, and not one dissenter found among them." Thomas Firmin, a most earnest Unitarian, disseminated his doctrines within the establishment. Milton's Unitarianism seems not to have been suspected in his time. A Calvinistic member of the church of England admitted that a large body of the clergy were lapsing into Socinianism. The great debate on the Trinity which engaged the religious world during the last 10 years of the 17th century, in which South and Sherlock took so conspicuous a part, was raised by Unitarians, who were numerous and able enough to draw attention to their opinions, though their publications bore no name of author, publisher, or printer. Before the close of the century they had their own places of worship in London. The writings of Locke favored indirectly the progress of Unitarian views. Locke himself disavowed the name of Socinian; but Edwards, in his "Socinianism Unmasked," made a direct attack on his "Reasonableness of Christianity." The publication of Hartley's "Observations on Man" gave rise to a new school, of which Joseph Priestley was the head. It was founded on the principles of the sensational philosophy, accepted religious truths on the evidence of miracle, and limited the number of those truths to the cardinal doctrines, the unity of God, and the general resurrection. Their opinions gained ground but slowly. Of this stamp was the Unitarianism that first made its appearance in America by the middle of the last century. Emlyn's "Inquiry into the Scripture Account of Jesus Christ" was republished in Boston in 1756, and extensively circulated; and the general tone of thought in Boston was decidedly Unitarian 80 years later. A Unitarian was made professor of divinity at Cambridge in 1805. Ten years later, the republi-

cation in Boston of Belsham's chapter on the "Progress and Present State of the Unitarian Churches in America," in his "Memoir of Lindsey," brought on the controversy between Dr. Channing and Dr. Worcester which resulted in a separation of the Unitarians from the "Orthodox," and the establishment of a sect. But American Unitarianism was to no considerable extent an echo of English thought. Channing exerted a powerful influence on American and even on English Unitarianism, and gave them a new direction, partly by withdrawing interest from points of controversial divinity, partly by subordinating theories and religion to the religious life, but more by bringing into light the spiritual elements of human nature, and thus initiating the practice of trying religious systems by the instincts and sentiments of the soul. To Channing Unitarianism owes much of its freedom from sectarian and dogmatic trammels. The writings of Lessing, Eichhorn, Herder, Schleiermacher, De Wette, and Strauss, the transcendental philosophy, the historical criticism, were all welcomed and studied by the successors of Channing, and all contributed largely to the formation of a new school of thought, which was adopted with most enthusiasm by Unitarians, and was represented in England by James Martineau, and in the United States by Theodore Parker.—The creed of Unitarians is not easily defined, for the reason that they disavow all right to frame or impose authoritative statements of opinion. Socinianism was a clear and coherent scheme of theological doctrine; but Socinianism was never identical with Unitarianism; the early English Unitarians took pains to signify their dissent from the system of Socinus, and at present very few Unitarians are Socinians. On one point only Unitarians have been always agreed, viz., the subordination of Christ. But respecting the degree of the subordination, and the extent to which other doctrines of Christendom have been affected by it, there has been no agreement. There are Unitarians who accept the Trinity in a philosophical sense, while rejecting the deity of Christ; and there are those not Unitarians who accept the deity of Christ, but reject the Trinity. Some Unitarians have held that Christ was an angelic being, from the beginning associated with the Father, and through him creating the world. Others have conceived him as a human being, miraculously endowed and supernaturally qualified to bring a revelation of truth. Others again have regarded him as a simple man of wonderful spiritual gifts, by which he obtained an extraordinary but natural mastery over souls and bodies, and through which he organized a society called the church. Some have asserted and some have denied his preëxistence; some have admitted and some have rejected his miraculous birth; some have doubted, while others have laid stress on his miraculous history; with some he has been an inspired prophet, with others an ideal man, with others a perfect example of moral excellence,

and with a few the type of a new order of human beings, the inaugurator of a new social state. Some, while refusing to ascribe to him omnipotence, omniscience, or omnipresence, have claimed for him infallibility, impeccability, and a perfectly righteous will; others have contended that his whole nature was confined within human limitations. One class speak of Christ as saviour, mediator, intercessor, and final judge; another class drop all these appellations, and know him only as teacher, quickener, and guide. Here he is venerated as Lord; there he is loved as brother. The Polish Unitarians debated the point of offering divine honors to Christ. Socinus, though refusing to accept the preëxistence, refused the Christian name to such as would not pray to Jesus. There have been Unitarians who taught that the Holy Spirit was a person; but now, so far as we know, all agree in considering it an influence.—The rejection of the dogma of the deity of Christ has brought with it the rejection, in more or less absolute form, of other characteristic dogmas in the creed of Christendom. The doctrine of total depravity and moral inability was among the first to fall. All Unitarians contend for man's power to receive moral illumination; most claim a freedom of choice between good and evil, and the natural power to obey the right. A few accept the doctrine of a fall, but hold that its consequences were never destructive of the innate rectitude of human nature, or of the law written on the heart; a few reject the doctrine of hereditary and transmitted qualities, and maintain that the soul of each new-born child is like a sheet of white paper unpledged to good or evil; some others recognize the law of transmission, but contend that man, instead of beginning his career as a perfect being, began at the lowest point of imperfection, and has since been making progress toward his full development in mind and character. With the dogma of depravity fell that of the infinite sacrifice, a vicarious atonement being unnecessary, since man is supposed to be in possession of his own moral and spiritual powers; and impossible, since the Christ has lost the rank necessary to render his sacrifice adequate to the great end. The Unitarian view of the atonement depends of course on the view of Christ and of human nature, and so belief ranges all the way from a modified conception of a Saviour's redeeming office to the opinion that his whole function was discharged in his office of teacher and exemplar.—The first phase of Unitarianism in any country may be most fitly described as Anti-Trinitarianism; the next, a fuller statement of the simple positive doctrine, the unity of God. At first the divine unity was conceived numerically, as unitheism, in opposition to tritheism and polytheism; the God was a being of undivided metaphysical personality, of a single consciousness. He was the one God of the Hebrews, an individual being who dwelt external to his works, ruled them from without, and con-

communicated with them by miracle. But gradually a different idea was entertained. Especially the moral unity of God was emphasized—the perfect harmony of the divine attributes, the perfect consistency of the divine purposes, the absolute dominion of the divine goodness. God was known and spoken of as Father, the paternal relation summing up and absorbing every other. By pursuing this idea of the divine paternity, the belief was arrived at that no power of pure malignity had an existence in the universe; that there was no personal Satan; that evil was no absolute entity, limiting, marring, or thwarting the beneficent energies of the Supreme; that the whole universe was dispossessed of demons, and belonged without reservation to the All-Good. Having reached this point, and expelled Satan from the world this side the grave, it was impossible not to go further and expel him from the region which lay on the other. Unitarianism has therefore earnestly contended against the doctrine of everlasting punishment of the wicked. While it holds no fixed or consentaneous opinion in regard to the state of being in another life, it has asserted that the state of being could not in any case be one of hopeless misery. There might be suffering, severe in degree and indefinite in duration; but it would be disciplinary, not vindictive in its purpose, and it would cease when its beneficent end was secured. Unitarians have insisted very strongly on the doctrine of retribution, but its object was never supposed to be the infliction of suffering for its own sake, or to satisfy merely the moral law; many have contended that the pain was but the necessary consequence or the inevitable concomitant of sin, enduring as long as that endured, and no longer; but the prevalent theory is probably that of the progressionists, who hold that the next life is the continuation of this, and that the soul under new conditions carries forward to its completion the process of spiritual development begun here.—The same general modification of view that characterizes the Unitarian thought in the particulars already mentioned, may be observed in the opinions respecting the Bible. The Polish Unitarians mostly held fast to the inspiration of the Scriptures, and appealed to them as final authority in all points of religious belief. The early English Unitarians did the same. The “new school” (if we may use the phrase for the sake of distinctness) do not appeal to the Scriptures as inspired and infallible oracles, but discuss religious questions on grounds of philosophy alone. Regarding the Bible as the most interesting and valuable part of the world’s literature, they seek in it illustration of the spiritual laws, but not final statements of moral and religious truth.—In regard to church government, it is enough to say that the congregational form is the prevalent, perhaps the only one. Each society manages its own affairs, temporal and spiritual, in its own way. Councils are seldom

called, and when called they can pass no decree. Strictly speaking, Unitarianism has no established ritualism, no priestly order, no indispensable, saving sacraments. From the beginning until now the prevailing view of the Lord’s supper has been that of Zwingli; and though here and there it has been taught that the communicant partook spiritually of the body of Christ, or received a special grace from the elements, these instances have not been numerous enough to qualify the assertion that the “communion” is observed in the Unitarian churches as a memorial rite dear to the affections and sacred by association, but carrying with it no special efficacy, demanding in its participant no special holiness, and useful only as a means of cultivating the religious life. In several societies of the “new school” it has been dispensed with altogether. Greater diversity of opinion has obtained respecting baptism than respecting communion. The early Unitarians on the continent and in England opposed infant baptism, but advocated strenuously the baptism of adults. Socinus thought it of little consequence whether one were baptized or not. There are those to-day who think it of considerable moment that children should be baptized; others deem it of no moment whatever. For the most part, when observed, it is made a social household ceremony, and is cherished for the pleasing sentiment that is associated with it.—The worship in Unitarian assemblies is very simple. In 1785 the society worshipping in King’s chapel, Boston, eliminated Trinitarianism from the “Book of Common Prayer,” and retained the book in its altered form. In other places, societies have compiled books of worship for themselves. In most there is no book. Efforts have been made recently to render the public worship attractive by a “vesper service” of a musical and devotional character. In some portions of the denomination an ecclesiastical spirit has shown itself working to reanimate the body of the church by restoring the declining interest in the institutions and ceremonies.—The progress and spread of Unitarianism has never been rapid, and such advance as it has made has been due more to the general movement of society than to its own conscious efforts. There is little recognized Unitarianism on the continent of Europe. Most of the Protestant ministers in Holland and Germany, it is believed, hold Unitarian opinions. In Paris these opinions are supported by government like other forms of faith, and one of the most eloquent preachers there, Athanasius Coquerel, has for years proclaimed the Anti-Trinitarian doctrines. Recently, the writings of Channing have excited interest in Paris. In Great Britain there are about 818 congregations, of which England has 285 with 226 ministers, Scotland 6 with 5 ministers, Ireland 42, and South Wales 80. The Unitarians have 5 periodicals. Missionary operations are conducted through the British and foreign Unitarian association. The

English Unitarians have been largely interested in philanthropic undertakings. They early established the domestic mission in London; and at present they have 10 laborers at work in London, Birmingham, Bristol, Manchester, Liverpool, and Halifax. Unitarianism in America had its birth and still has its head-quarters in Boston. If it goes to other parts of the country, it goes with New Englanders. There are in the United States about 268 societies, of which Massachusetts has 164, and the city of Boston 21; Maine has 16, New Hampshire 15, Vermont 3, Rhode Island 3, Connecticut 2, New York 13, New Jersey 1, Pennsylvania 5, Maryland 2, Ohio 5, Illinois 11, Wisconsin 2, and Missouri, Kentucky, Minnesota, South Carolina, Louisiana, California, and the district of Columbia, each 1. There are about 339 ministers. The "Christians" of the West, a very numerous body, are Unitarian in theology; so for the most part are the Universalists. The divinity school at Cambridge, Mass., is Unitarian, and so is the Meadville (Penn.) theological school. The periodicals published by the denomination are 8 in number. The American Unitarian association commenced its existence in May, 1825. Its purpose was to effect "more systematic union and a concentration of labors by which interest may be awakened, confidence inspired, and efficiency produced." On the same day, without concert, a similar association was formed in England, bearing the title of the British and foreign Unitarian association. In the first year the American association received less than \$1,900; now it receives annually from \$12,000 to \$13,000. It has assisted nearly 100 churches which required foreign aid; issued 277 tracts, in editions varying from 2,000 to 8,000 copies, making a total of 1,764,000, beside reports and miscellaneous tracts; distributed 1,100 sets of Dr. Channing's works, and 1,500 copies of Dr. Peabody's "Doctrinal Lectures;" expended in 8 years for the purchase, printing, and publication of books, \$43,090; employed as many as 20 home missionaries; and for several years supported a missionary in India. Closely affiliated with the association is the "Christian Book and Pamphlet Society," established by young men in 1827, which in the past 9 years has circulated gratuitously over 38,000 pamphlets and 4,500 books. The missionary and charitable societies in Boston under Unitarian support or patronage are too numerous to be particularly mentioned here.

UNITAS FRATRUM. See MORAVIANS.

UNITED BRETHREN IN CHRIST, a Protestant church, having no ecclesiastical connection with the Moravians, with whom they are frequently confounded. They arose among the Germans in Pennsylvania about 1760. In 1752 Philip William Otterbein, a missionary of the German Reformed church, sent out to America by the synod of Holland, began to preach in Lancaster, Penn., but soon becoming convinced that he was not himself a converted man, rest-

ed not until he experienced what he regarded as the new birth. This new experience led him to institute meetings during the week for prayer and religious conference. The interests excited by these proceedings, and the spiritual destitution of the country, induced him to hold in barns and groves in various places outside of his pastoral charge, what were called "great meetings." To one of these, held at Isaac Long's, in Lancaster co., all persons who had experienced a change of heart, without respect to their ecclesiastical relations, were especially invited. A large assembly, in which Lutherans, Reformed, Mennonites, Dunkers, Amish, and Moravians were represented, convened; and among the number was found Martin Boehm, a Mennonite preacher, who had also some time before obtained what he deemed the new life. At the conclusion of a remarkably effective sermon by Boehm, Otterbein arose, and embracing him, exclaimed: "We are brethren!" This was the origin of the name of the new church. Otterbein and Boehm labored together for more than 50 years; and as the calls for preaching became numerous, laymen selected from the converts were licensed to preach. These laborers at first held conferences at the great meetings; but when this became impracticable, annual conferences were appointed, where preachers were licensed, examined, disciplined, and directed in their labors. In 1859 the church had 29 annual conferences; 1,150 ministers, 700 of whom were itinerant; 386 circuits; 25 stations; 224 missions, 63 of which were established in 1858-9; 4,507 preaching places; 880 meeting houses; 3,199 classes; and 84,000 members. It has at Dayton, Ohio, an extensive printing establishment, where several periodicals and a variety of books are issued, in English and German. It owns 7 institutions of learning, viz.: Otterbein university, Ohio; Hartsville university, Ind.; Michigan collegiate institute, Mich.; Western college, Iowa; Blandinsville seminary, Ill.; Fremont seminary, Kansas; and Sublimity college, Oregon. The United Brethren in Christ have but one grade of ministers, are Arminian in theology, and supply their churches with preaching on the itinerant plan. They have quarterly, annual, and general conferences. The highest ecclesiastical body is the general conference, which meets every 4 years, and is composed of delegates from the conference districts elected by ballot, every member of the church being entitled to vote. No slaveholder, no adhering member of any secret combination, and no manufacturer, seller, or drinker of intoxicating liquors can be a member of the church. They regard a change of heart as an indispensable condition of membership. Baptism is administered by either sprinkling, pouring, or immersion, each member being permitted to exercise his own judgment in regard to the mode; infants are baptized when it is desired. Open communion at the Lord's table is practised. Until about 1835 the Unit-

ed Brethren in Christ confined their labors almost exclusively to persons speaking the German language; but at present by far the greater number of the communicants speak English. They have churches in the eastern, middle, southern, and western states, in most of the territories, and in Canada. In some of the western states this church is among the largest denominations.—See "History of the United Brethren in Christ," by G. Lawrence.

UNITED EVANGELICAL CHURCH, an ecclesiastical denomination in Germany, which arose in 1817 out of a union of the Lutheran and Reformed churches. Attempts at uniting these two churches were made as early as 1529, when leading theologians of both schools held a conference at Marburg. Though fruitless, these attempts were often renewed, and other religious conferences between theologians of the two denominations were held at Leipsic in 1681, and at Cassel in 1661. In 1708 Frederic I. of Prussia convened several Lutheran and Reformed theologians at Berlin, to discuss the practicability of a union. He erected union churches at Berlin and Charlottenburg, and had the orphans of the two denominations brought up in the same establishments; but the Lutheran clergy made a successful resistance to the progress of these schemes. A "Plan of Union" proposed by Klemm and Pfaff, theologians of Tübingen from 1710 to 1722, met with little favor. Frederic's successor, Frederic William I., issued several decrees designed to promote a union. The rise of rationalism, toward the close of the 18th century, disposed the theologians generally in favor of a union of the two churches, whose distinctive tenets, it was generally admitted, had but few believers among the clergy of either. Schleiermacher proposed to establish at first only an external church unity, and to leave the controversies of scientific theology open to discussion. The tercentenary of the reformation in 1817 led at length to the practical establishment of the union, which, however, in the opinion of many of its advocates, was to consist at first only in the establishment of a common church government and the common celebration of the Lord's supper. The leadership in this movement was assumed and has ever since been maintained by the government of Prussia. The clergy of Berlin issued a declaration in favor of the union, and a circular of the minister of the interior confirmed it, and decreed that the united church should bear henceforth the name Evangelical Christian church. It was thought that the union would be gradually and peaceably consummated by an agreement respecting a constitution, church property, and ordinary usages. It was also decided that the Lord's supper should be celebrated by a mere breaking of the bread and a faithful recitation of the words used in the original institution. For several years this work appeared to be in process of accomplishment in the several ecclesiastical corporations, sometimes by public

enactments and sometimes as the government directed, by a practical acceptance of the breaking of the bread and an acknowledgment of the authorities of the united church; but it was considerably disturbed by the introduction of a new liturgical book, the *Agenda*. A theological commission, appointed to compose such an instrument, accomplished nothing. The king then published an *Agenda*, which had been introduced by his cabinet (1822) into the court church, gave orders that it should be introduced into the garrison churches of his kingdom, and recommended it to all the congregations of the realm, instead of the conflicting and arbitrary forms which had previously been used in the different provinces. Many objections were raised against the *Agenda*, especially by the strict Lutherans; and when in 1834 a royal decree was issued ordering its introduction into all non-united as well as united congregations of the kingdom, a number of strict Lutherans seceded from the national church. For several years the government endeavored by the suspension of ministers to coerce them back into the national church; but in 1845 Frederic William IV. conceded liberty of worship. They then organized an independent Lutheran church, which numbered in 1861 about 60,000 members. All the rest of the former Lutheran and Reformed churches of Prussia, embracing about 10,000,000 souls, are nominally connected with the United Evangelical church. There is great difference of opinion, however, as to the nature and extent of the union by which the United Evangelical church has been called into existence. One party—generally called the confederalists—under the leadership of Prof. Hengstenberg and the late Dr. Stahl, maintain that the union consists in a mere external confederation and subjection to the same general church government; that the individual churches remain Lutheran, Reformed, or (if they have expressly adopted the union) United; and that if the right of adhering to the old standards of the Lutheran confession should be curtailed, it would become the duty of the party to secede. A second party, commonly called the consensus party, takes for its doctrinal basis the Bible and the common dogmas of the Lutheran and Reformed confessions. It controls the theological faculties of most of the universities, not only in Prussia, but in the other German states. Among its leading men are Nitzsch, Twisten, Hoffmann, Niedner, Tholuck, Julius Müller, Jacobi, Dorner, Lange, Liebner, Stier, Ullmann, Umbreit, Ebrard, Herzog, and Rothe. A third party, frequently designated as the union party, reject the authoritative character of the old symbolical books of both the Lutheran and the Reformed denominations, and base themselves on the Bible simply, claiming at the same time the right of subjecting the authenticity of the Old and New Testaments to critical examination. This party embraces many of the disciples of Schleiermacher, the

school of Tübingen, and a number of liberal divines of different shades of opinion. The second and third parties agreed in asking for the introduction of a presbyterian church constitution, embracing district, provincial, and general synods; but their exertions were vigorously resisted by the confederalists. Frederick William IV., who repeatedly declared his wish to restore full self-government to the national church, convoked in 1846 a general synod, in order to complete her organization. The work was interrupted by the revolution of 1848, but resumed in 1856 by another general conference, and began to be carried out upon the accession to the government of the regent, now King William I., in 1858.—The example of the king of Prussia in consolidating the Lutheran and Reformed churches into a United Evangelical church was followed in a number of other German states. Thus the union was introduced, either by resolution of synods or by a general vote, in Nassau (1817), the Bavarian Palatinate (1818), Baden (1821), and even in Würtemberg (1827), where the Reformed church had hardly an existence. The union may be considered permanently established in the Bavarian Palatinate and in Baden, in both of which the church has a presbyterian constitution, inclusive of a general synod, which in both churches is unanimous in maintaining the union. In the other state churches, in which the consistorial element still prevails over the synodal, the views of the churches and congregations on the subject have never been fully ascertained, and their final relation to the United Evangelical church can be determined only after a completion of their ecclesiastical constitution. Saxony, Hanover, Bavaria proper, Mecklenburg, Brunswick, and several other states were too exclusively Lutheran, Switzerland too exclusively Reformed, to fall in with the movement. In Austria and France a fusion of the Lutheran and Reformed churches has also many friends, but nothing has been done as yet in the way of practical execution. In the United States there is a branch of the United Evangelical church of Germany, called *Evangelischer Kirchenverein des Westens*, founded at St. Louis in 1841.—See Hering, *Geschichte der kirchlichen Unionsversuche* (2 vols., Leipsic, 1836-'8); Nitzsch, *Urkundenbuch der Evangelischen Union* (Bonn, 1853); Julius Müller, *Die Evangelische Union* (Leipsic, 1854); Stahl, *Die Lutherische Kirche und die Union* (Berlin, 1858).

UNITED PROVINCES. See NETHERLANDS.

UNITED STATES OF AMERICA, THE, a republic in North America, lying between lat. 24° 30' and 49° N. and between long. 66° 50' and 124° 30' W. It is bounded N. by British America, from which it is in part separated by the river St. Lawrence and Lakes Superior, Huron, St. Clair, Erie, and Ontario; E. by the Atlantic ocean; S. by Mexico and the gulf of Mexico; and W. by the Pacific ocean. The greatest length of this vast region is from Cape

Cod on the Atlantic to the Pacific, near the parallel of lat. 42°, about 2,600 m., and the greatest breadth from Madawaska in Maine to Key West in Florida, about 1,600 m., the mean length being about 2,400 m. and the mean breadth about 1,300 m. The line of the frontier toward British America measures 3,303 m., and that toward Mexico 1,456 m. The boundary line on the ocean, including the larger indentations, is 12,609 m., of which 6,861 m. are on the Atlantic, 3,467 m. on the gulf of Mexico, and 2,281 m. on the Pacific. With the exception of a small portion of the N. E. coast, the shores on the Atlantic and gulf are low, while those on the Pacific are mostly bold and rocky. The most important indentations are Passamaquoddy, Frenchman's, Penobscot, Casco, Massachusetts, Buzzard's, New York, Raritan, Delaware, and Chesapeake bays, and Long Island, Albemarle, and Pamlico sounds on the Atlantic; Tampa, Appalachee, Appalachicola, Pensacola, Mobile, Black, Barataria, Atchafalaya, Vermilion, Galveston, Matagorda, Aransas, and Corpus Christi bays on the gulf; and San Francisco bay and the straits of Juan de Fuca on the Pacific. Politically the republic is divided into 34 states, 8 territories (including Arizona, not yet organized), and the federal district of Columbia. For convenience the states are generally classified by geographers as follows: eastern or New England states, Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut; middle states, New York, New Jersey, Pennsylvania, Delaware; southern states, Maryland, Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, Texas; western states, Arkansas, Tennessee, Kentucky, Ohio, Michigan, Indiana, Illinois, Wisconsin, Minnesota, Iowa, Missouri, Kansas, California, Oregon. The southern and western states are sometimes also subdivided as follows: southern, Maryland, Virginia, North Carolina, South Carolina, Georgia, Florida; south-western, Alabama, Mississippi, Louisiana, Texas, Arkansas, Tennessee; north-western, Kentucky, Ohio, Michigan, Indiana, Illinois, Wisconsin, Minnesota, Iowa, Missouri, Kansas, California, Oregon. The date of admission of the states into the Union and of the organization of the territories, their area, and their population according to the successive decennial censuses, are shown in tables I., II., and III. The areas are derived in some instances from the result of state surveys. The total area of the states and territories according to the report of the topographical bureau made at the close of 1853, and subsequently revised and amended, is 2,963,666 sq. m., of which 820,680 sq. m. belonged to the republic at the peace of 1783; about 899,579 sq. m. were added by the purchase of Louisiana, 66,900 by the acquisition of Florida, 318,000 by the annexation of Texas, 308,053 by the Oregon treaty, and 550,455 by the Mexican treaties. Mr. Kennedy, superintendent of the census bureau, estimates the total area at

3,280,572 sq. m. The commissioner of the general land office in 1860 estimated the land area of the states and territories at 2,948,257 sq. m. or 1,888,744,000 acres; or including the Indian territory, 3,010,277 sq. m. or 1,926,636,800 acres. The population of the 13 colonies at the breaking out of the war of the revolution in 1775 was 2,803,000, including about 500,000 slaves. Table IV. gives the number of deaf and dumb, blind, and insane persons in the United States in 1850 and 1860; table V., the increase per cent. of the population of each state and territory during the 10 years next preceding each decennial census; table VI., the nativities of the white and free colored population in 1850; table VII., the capitals of the states and territories, their population to the square mile, the valuation of real and personal estate, and the number of representatives of each state in congress under the censuses of 1850 and 1860; and table VIII., the population of all the cities and towns of the United States having over 12,000 inhabitants in 1860. The uncivilized Indians are not included in the census returns, and the Indian territory, not forming a component part of the republic, though belonging to it, is not counted in estimating the area. It has an area of 74,127 sq. m. In 1789 the number of Indians within the territory of the United States was 76,000. By the acquisition of new territory this number was raised to 129,366 in 1825, exclusive of those in the Missouri valley; and to 400,764 in 1853, though all the tribes have been rapidly diminishing. The numbers reported in 1853 were distributed, as nearly as can be ascertained, as follows: in the Indian territory, 91,428; New York, 3,745; North Carolina, 1,600; South Carolina, 200; Florida, 500; Alabama, 100; Mississippi, 1,000; Texas, 29,000; Wisconsin and Minnesota, 29,786; California, 100,000; Oregon and Washington territory, 28,000; Utah, 11,500; New Mexico, 45,000; Missouri valley (Blackfeet, Sioux, and other tribes), 43,480; the plains, or Arkansas river (Kioways, Comanches, Pawnees, &c.), 20,000. In Dec. 1861, the government held relations with 152 tribes, comprising 239,506 persons, of whom $\frac{1}{3}$ were females.—The rivers of the United States, exclusive of the St. Lawrence, which washes a portion of the northern frontier, may be comprised in four distinct classes. 1. The Mississippi and its affluents, which drain the entire region between the Alleghanies and the Rocky mountains. The chief of these affluents are, on the E., the Wisconsin, Illinois, Ohio, and Yazoo; and on the W., the Minnesota, Des Moines, Missouri, Arkansas, and Red river. Several of these rivers are streams of the first class, from 1,000 to 2,000 m. in length, while many of the secondary affluents have courses extending from 300 to 1,000 m. 2. The rivers which rise in the Alleghany chain and flow into the Atlantic. Of these, the most important, beginning at the N. E., are the Penobscot, Ken-

nebec, Connecticut, Hudson, Delaware, Susquehanna, Potomac, James, Chowan, Roanoke, Pamlico or Tar river, Neuse, Cape Fear, Great Pedee, Santee, Savannah, and Altamaha, all of which exceed 300 m. in length, and are navigable to a considerable distance from the sea. 3. The rivers of the southern slope, flowing into the gulf of Mexico, the principal of which, E. of the Mississippi, are the Appalachicola and the Mobile, and their affluents, and W. of the Mississippi, the Sabine, Trinity, Brazos, Colorado, and Rio Grande. 4. The rivers which flow into the Pacific, of which the most important are the Columbia, which has several large affluents; the Sacramento and the San Joaquin, which flow into the bay of San Francisco; and the great Colorado of the West, which has its terminus in the gulf of California. Few countries in the world contain so many lakes as the United States, though these are principally confined to the northern portion. Of the five great lakes, as they are called, the largest bodies of fresh water on the globe, with perhaps the exception of the newly discovered and imperfectly known lakes in the interior of Africa, four, viz., Superior, Huron, Erie, and Ontario, lie on the northern border, partly in the United States and partly in British America, while Michigan is wholly within the territory of the republic. So is nearly all of Champlain, another lake of great length, though far inferior in breadth to the five great lakes. Near the southern end of Lake Champlain, in New York, is Lake George, renowned for its beautiful scenery, a feature equally characteristic of a number of other lakes in the neighboring wilderness of the Adirondac, and of others in New England. Among the last mentioned, the most important are Moosehead in Maine, Winnepiseogee in New Hampshire, and Memphremagog, which lies partly in Vermont and partly in Canada. The northern part of Maine is thickly strewn with lakes of great beauty and considerable size; and in almost every part of New England sheets of water are abundantly found under the designation of ponds, which in Europe from their size and beauty would be classed as lakes. The central and western parts of New York contain several large lakes, the most remarkable of which are Otsego, Oneida, Cayuga, Seneca, and Skaneateles. In the southern states lakes of fresh water are rarely found except in Florida, where the principal is Okeechobee, and in Louisiana, where there are many lakes formed by expansions of the numerous rivers. Of these latter, Lakes L'Allemand and Chetimaches are large bodies of water. In the states of the northwest, lakes are very numerous in Wisconsin and Minnesota; the great number and size of those in the latter form indeed one of its most remarkable geographical features. The most noted lakes in the states and territories on the Pacific side are the Great Salt lake and Pyramid lake in Utah, Klamath lake in Oregon, and Tulare lake in California.—The principal mountain

chains of the United States are the Rocky mountains in the west and the Alleghanies in the east, the former being much the loftier and more extensive. These two chains divide the country into three great geographical regions: the Atlantic slope, between the Alleghanies and the Atlantic ocean; the Pacific slope, from the Rocky mountains to the Pacific; and the Mississippi valley, which lies between the two ranges. The Rocky mountains are a continuation northward of the Cordilleras of Central America and Mexico, and traverse in several ranges an area 1,000 m. broad from E. to W., embracing in all its parts nearly 1,000,000 sq. m. The most easterly of these ranges runs through the territories of New Mexico, Colorado, and Nebraska, and forms the dividing line between Dacotah and Washington; it includes in its ramifications the Spanish peaks, Pike's peak, and the Wind River mountains, in which is Fremont's peak, 13,570 feet high. The next great range of the Rocky mountains toward the west is called the Wahsatch mountains, lying S. of Great Salt lake, and under this and other names passing N. to the E. of that lake. In Utah these mountains spread over a wide district, and the ridges of the several peaks lie in various directions, the course of those known as the Uintah mountains being E. and W. The western portion of the Rocky mountain chain enters the United States on the S. from Lower California, and soon branches into two ranges, the highest of which, the Sierra Nevada, runs at the distance of about 160 m. from the Pacific, while the inferior parallel ridges, known as the Coast range, keep within 10 to 50 m. of the ocean, till in the N. part of California they mingle in confused groups again with the Sierra Nevada, where Mt. Shasta reaches an elevation of 14,000 feet. Through Oregon and Washington territory the distinction is still continued between the Coast range and the main range, which here drops the name of Sierra Nevada and takes that of Cascade mountains. The summits of the Sierra Nevada are generally above the limit of perpetual snow. The Coast range averages from 2,000 to 3,000 feet in height; but a few peaks rise to double that altitude, among them Mt. Ripley, 7,500 feet; St. John, 8,000; and Mt. Linn, the highest of the range, whose altitude however is not yet precisely ascertained. The Alleghanies, called also the Appalachian mountains, extend from Canada through western New England, the middle states, and the southern states, to Alabama. The White mountains of New Hampshire and the Adirondac mountains of New York are considered outliers of this great chain, though separated from the main stem by wide tracts of low elevation. The Catskills of New York also are outliers less distantly removed. All these groups are described in this cyclopædia under their own titles. The Alleghanies proper, not including these lateral groups, are about 1,800 m. in length, with an extreme width of 100 m., in Pennsylvania and Maryland, midway

of their course.—The geological features of the states being described in the account of each one under its own name, it only remains to present a general outline of the formations in this range through the country. The most ancient rocks, and no doubt the oldest known strata in the crust of the earth, are those designated by the Canadian geologists the laurentian series. They consist of gneiss more or less granitic, quartz rock, limestones, dolomites, conglomerates, and, in the upper portion, of feldspathic rocks and great bodies of iron ore. They are largely developed over a great portion of Canada, where they attain a thickness of 40,000 feet, and also occur in the United States in the Adirondac region of northern New York. These crystalline formations differ from those regarded as of more recent date, which constitute the Green mountains and the White mountains and the greater portion of the New England states, in the absence of argillaceous, talcose, and chloritic schists, and are also marked by various other mineralogical characteristics. The next overlying series of rocks, known as the huronian, is found in Canada, to the north of Lakes Huron and Superior, in great beds of quartz rock, conglomerates, limestones, slaty rocks of peculiar character, and diorites, which altogether attain a thickness of about 10,000 feet, and overspread extensive districts. On the S. shore of Lake Superior, this formation contains enormous beds of iron ore at Marquette and other neighboring localities. This series is regarded as the equivalent of the cambrian sandstones and conglomerates described by Murchison. Though classed with the laurentian as *ancient* rocks, numerous indications are observed of both these formations having originally been sedimentary deposits, and like those of more recent date abounding in organic bodies of the vegetable and animal kingdoms, the forms of which have been destroyed by the metamorphic action to which the rocks have been subjected. The most ancient fossiliferous rocks (belonging to the primordial zone of Barrande, and recognized by some geologists as establishing a group below the lower silurian, named by Dr. E. Emmons as far back as 1844 the "Taconic system"), characterized by the *paradoxa Harteri* and other ancient genera of trilobites, are found in the argillaceous schists at Braintree, Mass., in the central portion of North Carolina, and possibly in some slates at Georgia, Vt., which however the Canadian geologists regard as equivalent to the "Quebec group," and this as contemporaneous with the calciferous and Chazy formations of the lower silurian of New York. It is also maintained that some sandstones in Iowa and Minnesota referred to the lower silurian should by reason of their fossils be placed in this lower system. The crystalline and schistose strata of New England, extending S. W. through the highlands of New York and New Jersey, and thence through the Appalachian chain to Alabama, have been variously classed by different geologists. They consist of feldspathic

gneiss, quartz rocks, argillaceous, micaceous, talcose, and chloritic slates, &c.; and while regarded by some as forming the base of the Appalachian system, other geologists consider them as metamorphosed sandstones, shales, limestones, &c., of the lower silurian series. These, together with the unaltered rocks of this group, and those which succeed it, including the devonian and carboniferous, constitute the whole of this chain. From its range westward the whole country to the Rocky mountains, with the exception of the Ozark mountain region in southern Missouri and a few localities in Wisconsin and the northern peninsula of Michigan, contains no crystalline rocks. The lower silurian limestones come up to the surface at Cincinnati, O., Frankfort, Ky., and Nashville, Tenn., separating with the accompanying upper silurian members the great coal field of W. Pennsylvania, E. Ohio, Virginia, E. Kentucky, and Tennessee from the western coal fields of Illinois, Indiana, and W. Kentucky. On the north, a third coal field occupies the central portion of the lower peninsula of Michigan; and to the north-west a fourth coal field of great extent spreads over nearly the whole of Iowa, N. Missouri, and a large part of Kansas. The carboniferous series, wherever met with, is the uppermost formation, excepting in Illinois, Iowa, and Kansas, where the permian strata have been recognized. The great plains that extend from the Missouri and up the valleys of the Arkansas, Red river, &c., to the Rocky mountains, are almost exclusively occupied by cretaceous rocks, sometimes overlaid by those of tertiary age. These groups are an extension of those which form the whole country bordering the gulf of Mexico, and extending inland toward the southern extremity of the Appalachian mountains. Florida, Louisiana, and the coasts from Texas to Martha's Vineyard are composed of the tertiary, the belt gradually diminishing in width toward the north-east. The most recent members of this class are found in general near the coast, the older strata cropping out inland. Nowhere are they broken in upon or the strata disturbed by the intrusion of eruptive rocks of more recent date. Their elevation is evidently due to a continental and slow movement. The cretaceous formation passes across New Jersey and N. Delaware from New York bay to the head of Chesapeake bay, occurs at a few points in S. E. Virginia, near Wilmington, N. O., and through central South Carolina and Georgia, and thence stretches continuously in a broad belt through central Alabama, curving N. through N. Mississippi and W. Tennessee. It rests in general upon the metamorphic belt of the Appalachians, and the ascent to the higher platform of these rocks S. of New York is commonly marked by the first or lowest falls of the rivers, determining the head of navigation. (See APPALACHIAN MOUNTAINS.) The lower jurassic formation is represented in the narrow belt of red sandstones along the lower valley of the Conne-

ctic, continued through New Jersey and across Pennsylvania into Virginia. The coal fields of S. E. Virginia and of North Carolina are referred to this group. Beside the great coast range of the tertiary formations already named, the newer pliocene is met with in scattered localities in the S. part of Maine and on the borders of Lake Champlain. The drift formation covers all the northern portion of the United States, the southern limit of the bowlders sometimes reaching lat. 40° N. The most southern diluvial scratches are found on the road through the gap of Peter's mount above Harrisburg near the Susquehanna, in lat. $40^{\circ} 30'$. The deposits of alluvium are of comparatively little extent, being mostly limited to the borders of the rivers and lakes. At the mouth of the Mississippi river only they spread out into a delta of broad area. Beyond the Mississippi valley the metamorphic groups of the Appalachians are repeated upon a grander scale in the Rocky mountains; but between the numerous ridges appear wide belts of the cretaceous strata and of modern tertiary deposits. Of such formations consist the vast arid plains and slopes stretching out toward the Pacific. In the mountainous districts are found all the formations from the lower crystalline groups to the coal, often traversed by great dikes of trappean and other eruptive rocks, some of which are traced to volcanoes but recently extinct or still active. An interesting volcanic district on the Colorado river of the West is described by Lieut. Joseph C. Ives in his report of explorations made for the U. S. government in 1857 and 1858. Beyond the Sierra Nevada and Cascade mountains the country extending to the Pacific is chiefly occupied by tertiary strata, which have been so broken up by movements of the crust and volcanic eruptions, as to present an excessively rugged surface and diversified structure. The metals in the Atlantic division generally follow the range of the Appalachians, and, excepting the copper region of Lake Superior, the lead mines of the West, and some iron mines in the same region, few metallic districts of importance are met with except in the crystalline rocks connected with this range of mountains. The metalliferous belts of New Mexico in like manner accompany the range of the same rocks in the Rocky mountains, and of California those of the Sierra Nevada, the debris from which, swept down into the tertiary strata, have furnished these with the precious metals for which they are extensively worked.—The soil presents almost every variety, from the dry sterile plains in the region of the Great Salt lake to the rich alluviums of the Mississippi valley. It can most conveniently be described by following the 7 great divisions indicated by the river systems of the country, viz.: the St. Lawrence basin, the Atlantic slope, the Mississippi valley, the Texas slope, the Pacific slope, the inland basin of Utah, sometimes called the Great or Fremont basin, and the basin of the Red river of the North. 1. The St. Lawrence basin embraces

parts of Vermont, New York, Pennsylvania, Ohio, Indiana, Illinois, Wisconsin, and Minnesota, and all of Michigan; it is an elevated and fertile plain, generally well wooded. 2. The Atlantic slope includes all New England except a part of Vermont; all of New Jersey, Delaware, the District of Columbia, South Carolina, and Florida; and portions of New York, Pennsylvania, Maryland, Virginia, North Carolina, Georgia, Alabama, and Mississippi. It may be subdivided into two regions, a N. E. section and a S. W. section, separated by the Hudson river. The former is hilly, and generally better adapted to grazing than tillage, though some parts of it are naturally fertile, and a large proportion is carefully cultivated. The S. W. section may be again divided into a coast belt from 30 to 150 m. in width, running from Long Island sound to the mouth of the Mississippi, and including the whole peninsula of Florida; and an inland slope from the mountains toward this coast belt. The former as far S. as the Roanoke river is sandy and not naturally fertile, though capable of being made highly productive; from the Roanoke to the Mississippi it is generally swampy, with sandy tracts here and there, and a considerable proportion of rich alluvial soil. The inland slope is one of the finest districts in the United States, the soil consisting for the most part of alluvium from the mountains and the decomposed primitive rocks which underlie the surface. 3. The Mississippi valley occupies more than two fifths of the area of the republic, and extends from the Alleghany to the Rocky mountains, and from the gulf of Mexico to British North America, thus including parts of New York, Pennsylvania, Maryland, Virginia, North Carolina, Georgia, Alabama, Mississippi, Louisiana, Texas, New Mexico, Ohio, Indiana, Illinois, Wisconsin, and Minnesota, and all of Kentucky, Tennessee, Arkansas, Missouri, Iowa, Nebraska, and Kansas. It is for the most part a prairie country, of fertility unsurpassed by any region on the globe, except perhaps the valley of the Amazon. The ground in many places is covered with mould to the depth of several feet, in some instances to the depth of 25 feet. The N. W. part of the valley, however, offers a strong contrast to the remainder. There is a desert plateau from 200 to 400 m. wide lying at the base of the Rocky mountains, at an elevation of 2,000 to 5,000 feet above the sea, part of it incapable of cultivation on account of the deficiency of rain and lack of means of irrigation, and part naturally sterile. 4. The Texas slope includes the country S. W. of the Mississippi valley, drained by rivers which flow into the gulf of Mexico, and embracing nearly all of Texas and portions of Louisiana and New Mexico. It may be divided into 3 regions: a coast belt from 30 to 60 m. wide, low, level, and very fertile, especially in the river bottoms; a rich rolling prairie, extending from the coast belt about 150 or 200 m. inland, and admirably suited for grazing; and a lofty table land in the N. W., utterly

destitute of trees, scantily supplied with grass, and during a part of the year parched with complete drought. Almost the only arable land in this last section is found in the valleys of the Rio Grande and a few other streams. 5. The Pacific slope, embracing the greater part of California, Oregon, and Washington territory, and parts of New Mexico and Utah, is generally sterile. That part however between the Coast range and the ocean, and the valleys between the Coast range and the Cascade range and Sierra Nevada are very fertile, and the same may be said of a few valleys and slopes among the Wahsatch and Rocky mountains, though these are better adapted to pasturage than to any thing else. 6. The great inland basin of Utah, which includes beside Utah parts of New Mexico, California, Oregon, and Washington, is probably the most desolate portion of the United States. It abounds in salt lakes, and there are only a few valleys where the soil acquires by irrigation enough fertility to afford a support for man. 7. That portion of the basin of the Red river of the North which belongs to the United States is confined to the small tract in the N. part of Dacotah and Minnesota; it contains some very productive lands, especially in the river bottoms. The climate of the United States is as varied as might be expected in a country stretching through 25 degrees of latitude, and rising from low swampy shores to vast elevated and arid table lands and prodigious mountain ranges. With the exception of the peninsula of Florida, where the range of the thermometer during the year does not exceed 12°, its most prominent feature is fickleness. Transitions from heat to cold and from cold to heat, to the extent of 30° in a few hours, are common at all seasons in almost all parts of the country, and the alternations from rain to drought are nearly as remarkable. The summer is everywhere marked by intense heat, the thermometer rising sometimes as high as 110° F. In the north, however, this intense heat is seldom continued for more than a few days at a time, and in the southern states the heat, though long continued, is seldom so extreme. The Atlantic states have in general a temperature about 10° more severe than countries of the same latitude in western Europe, while California on the other hand has a climate as mild as that of Italy. The north-eastern states are subject to chill winds from the Atlantic, especially in the spring months, and the ice fields of British North America are the cradles of cold blasts which, having no mountain barrier to overcome, sweep over the northern states upon every considerable rise in the temperature further south. The great lakes mitigate to some extent the temperature of the country surrounding them, and other local features, such as the elevated plains of New Mexico, Oregon, and Utah, affect the climate of particular parts of the country. The isothermal line which passes through New Haven (aver-

ago annual temperature 50°), in lat. 41° 18', defects but little either N. or S. until it reaches Fort Laramie in Nebraska, whence it turns S. to lat. 85° in New Mexico, and then as suddenly stretches off to the N. into British Columbia. The following table shows the average temperature of each of the 4 seasons and of the year at several points on the Atlantic and Pacific coasts and in the interior:

Place of observation.	Latitude.	Spring.	Summer.	Autumn.	Winter.	Year.
Fortress Monroe, near Norfolk, Va.	37°	56.57°	76.57°	61.68°	40.45°	53.89°
Fort Columbus, N. Y. harbor	40° 43'	43.74°	72.10°	54.55°	81.88°	51.69°
Fort Sullivan, Eastport, Me.	44° 15'	40.15°	60.50°	47.59°	23.90°	43.03°
St. Louis, Mo.	38° 40'	54.15°	76.19°	55.44°	32.37°	54.51°
Chicago, Ill.	41° 52'	44.90°	67.38°	43.85°	26.90°	48.75°
Fort Ripley, Minn.	46° 19'	39.33°	64.94°	42.91°	10.01°	39.30°
Monterey, Cal.	36° 36'	58.99°	58.64°	57.29°	51.22°	55.29°
San Francisco, Cal.	37° 48'	54.41°	57.38°	56.88°	50.86°	54.88°
Astoria, Oregon	46° 11'	51.16°	61.58°	53.78°	42.43°	52.23°

Rain is abundant over the greater part of the republic, and pretty equally distributed throughout the year, as is shown by the following table of the fall in inches at various points:

Place of observation.	Spring.	Summer.	Autumn.	Winter.	Year.
Eastport, Me.	8.89	10.05	9.85	10.61	39.39
Providence, R. I. (average 23 years)	39.71
Albany, N. Y. (average 30 years)	40.00
New York	11.55	11.38	10.30	9.63	42.23
Philadelphia, Penn. (average 23 years)	42.80
Baltimore, Md.	11.13	11.04	10.52	9.31	42.00

In the north Atlantic states the fall is more regular than in the coast states S. of Washington, being in the latter more plentiful than in the former, and more frequent in summer than in winter. On the Pacific coast the rains are periodical, occurring chiefly in winter and spring, and S. of lat. 40° in autumn also. Between long. 100° and the Cascade range there is very little rain, though even this sterile district experiences violent showers, especially among the mountains. The annual

fall in the desert region through which the Colorado flows, is estimated at 8 inches; in the inland basin of Utah, 5 inches; in the great plain S. of the Columbia river, 10 inches; in the desert E. of the Rocky mountains, from 15 to 20 inches. Scarcely any of this fall occurs in summer. In the northern states snow frequently falls to a considerable depth, and in the region about Lake Superior more or less falls every day in winter, and does not melt until the spring. It is a comparative rarity S. of the Potomac, and when it does occur in the southern states it lasts but a very short time.—The most fatal diseases of the northern and middle states are affections of the lungs; of the southern states, bilious fevers, with occasional severe visitations of yellow fever along the gulf; and of the western states, intermittent and bilious fevers and dysentery. The fever and ague so prevalent in the west is attributed to the miasmatic exhalations incident to the breaking up of new lands, and rapidly disappears as the country becomes settled. The cholera has generally been more fatal in the valley of the Mississippi than in any other part of the country. According to the census of 1850, the number of deaths in the Union was 1 in every 72 inhabitants (1.39 per cent.), the greatest mortality being in Louisiana (1 in every 44), and the least in Oregon (1 in every 283). The following table shows the ratio of deaths to every 100 of the population in each of the states and territories for the year ending June 30, 1850:

Oregon	..	New Hampshire	1.23
Minnesota	..	Virginia	1.34
Wisconsin	..	Illinois	1.36
California	..	Arkansas	1.44
Vermont	1.00	Mississippi	1.44
Florida	1.06	Ohio	1.46
Iowa	1.06	Texas	1.46
Georgia	1.09	New York	1.47
Michigan	1.14	Rhode Island	1.52
Alabama	1.18	Kentucky	1.58
Tennessee	1.18	Connecticut	1.56
North Carolina	1.19	District of Columbia	1.68
South Carolina	1.20	Maryland	1.65
Pennsylvania	1.24	Missouri	1.90
Indiana	1.30	New Mexico	1.93
Maine	1.30	Massachusetts	1.95
Delaware	1.32	Utah	2.10
New Jersey	1.32	Louisiana	2.31

Florida, which figures 6th in the above table, is considered as healthy as any other part of the country, a large proportion of the deaths in that state being of consumptive and other invalids from the north, who resort there in winter. In judging of the climate of some of the other states from the mortality tables, an allowance should be made for the large cities, in which the ratio of deaths is always much higher than it is in the rural districts.—The variety of geological formations occurring over the extensive territory of the United States insures the existence and economical production at one point or another of most of the minerals useful to man. Coal, which is every year becoming more valuable for fuel, and for the production of gas and other processes of the arts, exists in all the states except Vermont, New Hampshire, Connecticut, New York, and New Jersey, and is of 8 distinct qualities, an-

thracite, bituminous, and semi-bituminous. It is mined to a considerable extent, however, in only a few of the states, and the production in 1860, as returned by the census, was as follows:

States.	Bituminous.		Anthracite.	
	Bushels.	Value.	Tons.	Value.
Rhode Island	95,000	\$23,500	1,000	\$5,000
Pennsylvania	66,994,295	2,533,559	9,397,332	11,589,574
Maryland	14,200,000	464,398
Virginia	9,542,627	690,188
Georgia	48,000	4,800
Alabama	10,000	1,200
Tennessee	3,474,100	413,693
Kentucky	6,732,000	476,800
Ohio	28,330,900	1,539,713
Indiana	879,085	27,600
Illinois	14,253,120	964,187
Iowa	73,500	6,500
Missouri	97,000	8,200
Wash'n Ter.	134,350	32,244
Total....	144,376,927*	\$7,491,191	9,398,332	\$11,574,574

Marl is found in extensive and valuable beds in Maine, New Jersey, Maryland, Virginia, and some of the other states. Salt springs, some of them producing brine of extraordinary strength, occur in New York, Michigan, Virginia, Kentucky, and Arkansas. Nitrates of soda and potassa are found in the caves of Virginia, Kentucky, and Alabama, and nitrate and carbonate of soda on the plains of the great American desert and the eastern slope of the Rocky mountain range. Sulphate of lime (gypsum) occurs in Maine, Maryland, Texas, and some portions of New Mexico and Arizona. Marble of every variety for building, ornamental, and statuary purposes, is found in most of the states; and a carbonate of lime, compact and suitable for building purposes, supplies its place in the states bordering on the Mississippi. Of the metals, iron is found in every state and territory, and in every form known, from the pure metal to the bog ore containing not more than 20 per cent. of iron. Lead exists in small quantities in many of the states, but the great deposits of galena or lead ore are in Missouri, Arkansas, Iowa, and Illinois. Copper has been mined in considerable quantities in Connecticut, New Jersey, Virginia, North Carolina, Georgia, and Tennessee; but the great copper region is that near Lake Superior, where ore is produced which yields from 71 to 90 per cent. of pure metal. Zinc is found in great abundance in New Jersey and Pennsylvania, and to some extent in other states. Tin has recently been discovered in Maine under circumstances which indicate the probability of its becoming an important product of that state; and it has also been discovered in California in considerable quantities. Silver, which exists in combination with lead in all the deposits of lead ore, and is also found in connection with copper in some of the mines, exists in large quantities and is profitably worked in the territories of Nevada, New Mexico, and Arizona. It is also found in California, in the territory of Colorado, and in North Carolina. Gold is found in small quan-

tities in Maine, Vermont, New Hampshire, Alabama, and Tennessee; Virginia, North Carolina, South Carolina, and Georgia formerly furnished the largest supplies of the country; while California, Oregon, Washington, Nevada, Arizona, New Mexico, Colorado, and Dakota with the colony of British Columbia, constitute probably the most extensive and productive gold region in the world. Platinum is found in California, though not in large quantity. Mercury is also found in California in such amount as to have supplied a considerable part of the large demand for it for mining purposes. Osmium and iridium have been discovered in Oregon, and are in demand by the manufacturers of gold pens. Cobalt occurs in North Carolina and Missouri; nickel in Connecticut, Pennsylvania, and Missouri; chromium in Vermont, New Jersey, New York, Pennsylvania, and Maryland; and manganese in Vermont, Massachusetts, Pennsylvania, and South Carolina. From the impossibility of obtaining correct returns of mineral productions, no tabular statement can be given; for fuller accounts and approximate estimates, the reader is referred to the separate articles upon them.—Botanists arrange the trees and shrubs of the United States in several provinces, each marked by a distinctive character and fixed limits. Two of these provinces extend northward into Canada, and two others pass over the boundaries in the south-west into Mexico; but the greater part are confined within the limits of the United States. 1. The lacustrine province extends along the basin of the great lakes and the St. Lawrence, and has for its boundaries the limit of forests on the north, the coasts of Labrador on the east, the line of N. lat. 43° on the coast, curving gradually southward to the Alleghanies, where it ascends again to the parallel of 60° at the Rocky mountains. Among the characteristic trees of this province are the *betula* or birch, of which 5 species are found, viz.: *B. papyracea* or paper birch, *B. excelsa*, *nigra*, *lenta*, and *populifolia*, known by the common names of yellow, black, sweet, and white old field birch; 3 species of *alnus* or alder, *A. incana* and *terrida*, or speckled and green alder; a single species of willow, *salix lucida*; 4 species of *populus* or poplar, *P. tremuloides* (aspen poplar), *balsamifera* (balsam poplar or tacamahac), *candicans* (balm of Gilead poplar), and *grandidentata* (soft aspen poplar); and 4 species of *abies* or spruce, viz.: *A. alba*, *nigra*, *balsamea*, and *Canadensis*, or white, black, balsam, and hemlock spruce or fir. Allied to the last named are the pines, of which only 3 are found in this province, *pinus Banksiana* (gray scrub pine), *resinosa* (red or Norway pine), and *strobus* (white pine). There are 2 junipers, *juniperus communis* and *Virginiana*, known as northern juniper and red cedar. The *thuya occidentalis* or Canadian arbor vitae, the *taxus Canadensis* or Canadian yew, and the *larix Americana* or larch tamarack, are the only other evergreens.

* Equal to 5,776,077 tons.

There are 8 species of cherry, *cerus Virginiana*, *serotina*, and *Pennsylvanica*, respectively known as choke, black, and red wild cherry; and allied to these is the *prunus Americana* or northern wild plum. There are 4 species of maple, *acer saccharinum*, *rubrum*, *Pennsylvanicum*, and *spicatum*, or sugar, red, striped, and mountain maple; 8 species of ash, *fraxinus Americana* and *sambucifolia*, white and black ash, and *pyrus Americana*, or American mountain ash; 2 species of elm, *ulmus Americana* and *racemosa*, or the weeping and northern corky elm; 4 species of oak, *quercus rubra*, *obtusiloba*, *alba*, and *macrocarpa*, or red, post or iron, white, and burr oak. The linden or basswood (*tilia Americana*) and red beech (*fagus ferruginea*) occur sometimes in large numbers, forming almost entire forests; the hop hornbeam, ironwood, or leverwood (*ostrea Virginica*) is less abundant, but occasionally appears with other trees. The box elder (*negundo aceroides*), the smooth sumach (*rhus glabra*), and the service berry (*amelanchier Canadensis*) are the principal tree-like shrubs of the province. 2. The Appalachian province comprises all of the Atlantic states S. of lat. 43° and E. of the border of the prairies, including thus both slopes of the Alleghanies and the low lands between them and the coast, as well as the Tennessee and Ozark mountains. This is divided for convenience into 6 regions, whose names sufficiently explain their situation, viz.: the Alleghany, Ohio, Tennessee, Carolina, Mississippi, and Florida regions. The trees of the Alleghany region are to a considerable extent allied, though often of different species, to those of the lacustrine province. Evergreens are not abundant, 4 species only, *pinus rigida*, *pinguis*, and *inope*, or northern pitch pine, Table mountain pine, and Jersey scrub pine, and *abies Fraseri* or southern balsam fir, being all that are peculiar to the region. The oak, of which there are 4 species, the chestnut (2 species), the hickory (8 species), and the butternut and black walnut (2 species), are the characteristic trees of this region; there are also 2 species of ash, *fraxinus pubescens* and *viridis*, and one each of logwood (*cornus alternifolia*), willow (*salix nigra*), *kalmia* (*latifolia*), *rhododendron* (*maximum*), buttonwood (*platanus occidentalis*), maple (*acer saccharinum*, var. *nigrum*), sassafras (*S. officinalis*), locust (*Robinia viscosa*), crab apple (*pyrus angustifolia*), and fringe tree (*chionanthus Virginianus*). Of shrubs, 2 species of sumach, the velvet and poison (*rhus typhina* and *venenata*), are the principal which are peculiar to the region. There are 8 species and numerous varieties of the grape common to this and the Ohio region, and one of them also to the Tennessee region, viz.: *vitis labrusca*, *asticalis*, and *cordifolia*, or the fox, summer, and frost grape. The Ohio region has but few characteristic trees; the most prominent are the *aculus glabra* or Ohio buckeye, the *cercis Canadensis* or redbud, scarlet and swamp oak (*quercus*

coccinea and *palustris*), 8 hawthorns (*crataegus orus-galli*, *coccinea*, and *tomentosa*), a soft maple (*acer dasycarpum*), the northern hackberry (*celtis occidentalis*), the red mulberry (*morus rubra*), and the northern prickly ash (*zanthoxylum Americanum*). To the Tennessee region belong the pawpaw (*asimina triloba*), the cucumber tree (*magnolia acuminata*), as well as the large-leaved and other magnolias (*macrophylla*, *umbrella*, and *Fraseri*), the bitter hickory (*carya amara*) and thick shellbark hickory (*C. sulcata*), the common locust (*Robinia pseudocacia*), the eatable buckeye (*asculus macrostachya*), the yellow wood (*cladastria tinctoria*), 2 species of the *Halasia* or bell tree, *H. diptera* and *tetroptera*, the Osage orange (*Maclura aurantiaca*), the thick-leaved elm (*ulmus crassifolia*), the smoke tree (*rhus cotinoides*), the honey locust (*Gleditschia triacanthos*), one species of hawthorn (*crataegus cordata*), the southern beech (*fagus sylvestris*), the housewood (*oxydendrum arboreum*), the yellow or spruce pine (*pinus mitis*), and the laurel or shingle oak (*quercus imbricaria*). The coast or Carolina region, which really extends from Maine to Georgia, has for its characteristic trees the dogwood (*cornus*), of which there are 5 or 6 species; the magnolia, of which there are at least 4 species, one of them, *M. grandiflora*, being one of the most beautiful flowering trees of North America; the *crataegus* or hawthorn, 4 species; the *cupressus* or cypress, and the *taxodium*, an allied genus; the *chamaerops palmetto*, or tree palmetto; 2 or 3 species of pine, one of them of great commercial importance; the stately *liquidambar tulipifera*, known by the names of whitewood, tulip tree, American poplar, &c.; 8 or 9 species of oak, of which the most peculiar are the Spanish oak (*quercus falcata*), whose parasite the Spanish moss gives it so funereal an appearance; the blackjack oak (*Q. nigra*), whose wide-spreading roots form a corduroy network, which greatly impedes locomotion on the ordinary highways; and the live oak (*Q. virens*), which furnishes the finest ship timber in the world. There are also several species of *bumelia*, and at least two of the *nyssa* or gum tree, viz., *N. multiflora* (peppertree or sour gum) and *N. uniflora* (southern tupelo). The cottonwood (*populus angulata*), though properly belonging to the Mississippi region, is found to some extent in the low lands of the southern Atlantic states. There are several species of the *Gordonia* or bay, one of them common to this and the Mississippi region. A single species of a tribe allied to the bamboo, the *arundinaria macrosperma* or giant cane, is found as far N. as lat. 88° 30'; the persimmon (*diospyros Virginiana*), and the single representative of the chestnut tribe, the chinquapin (*castanea pumila*), also belong to this region. The characteristic forest vegetation of the Mississippi region consists rather in large forests of particular species than in any considerable number of species. The cottonwood is abundant along the streams; the cy-

press (*taxodium*) is found near the bayous and swamps; the *magnolia grandiflora* is found also in low situations, as are several species of swamp oak (*quercus prinus* and *aquatica*), hickory (*carya microcarpa*), and ash (*fraxinus platycarpa*). The catalpa (*C. bignonioides*), planer tree (*planera aquatica*), Chickasaw plum (*prunus Chickasa*), and buckwheat tree (*Oliftonia ligustrina*) are among the more remarkable of the forest trees native to this region. The lime, lemon, orange, and fig, which have been introduced from the West Indies, flourish luxuriantly. Of climbing plants, the Catawba grape is a native of this region. In the Florida region, the principal forest trees are the live oak (*quercus virens*); the *Eugenia latifolia*, *procera*, and *buxifolia*, or *Eugenia*; the *Torreya taxifolia*, or stinking cedar; two species of fig, *ficus brevifolia* and *aurea*; the bitter-wood (*simaruba glauca*), whose bark is used for medicinal purposes; two species of wild plum, *coccoloba wifera* and *Floridana*; the *chrysobalanus icaco*, or cocoa plum; the *papaya vulgaris*, or true pawpaw; the *anona laurifolia*, or laurel-leaved custard apple; the *acacia latifolia*, or broad-pod acacia; the *podium buxifolium*, or box-leaved guava; the *crecentia*, or seven-year apple; the *laguncularia* and the *rhizophora*, both called mangrove; the *ardisia Pickeringii*, or Florida ardisia; and the *rhus metopium*, or broad-leaved poison sumach. A peculiarity of the region is the predominance of fruit-bearing trees. 3. The campestrian province comprises the vast extent of prairie lands, reaching from the Saskatchewan on the N. to Texas on the S. This province is mostly treeless except near the streams; it has very few trees which are not common to it with the Mississippi, Ohio, and Canadian regions. The pecan nut (*carya oliviformis*), though found in the Mississippi region, attains its greatest perfection here. The cottonwood (*populus monilifera*), the white elm (*ulmus Americana*), the white ash (*fraxinus Americana*), and the red cedar (*juniperus Virginiana*) are the most abundant trees of the province, though none of them peculiar to it. 4. The Rocky mountain province, like the preceding, has few peculiar or characteristic trees as yet known. The table lands stretching eastward from the summits of the Rocky mountain range are treeless and almost verdureless, except on the immediate banks of the streams, where a few cottonwood or other trees of quick growth and spongy fibre are found; elsewhere the wild or bitter sage (*artemisia tridentata*), greasewood (*Purshia tridentata*), and other plants of a like character form the only herbage of the barren and soda-covered soil. Higher up on the mountain slopes there are found 8 species of pine, and perhaps more, viz., *pinus Wislizeni*, *flexilis*, and *monophyllus*, the last a variety of the valuable nut pine. A single species each of maple (*acer tripartitum*), willow (*salix pentandra*), cedar (*juniperus occidentalis*, found in Utah), hackberry (*celtis reticulata*), and elder

(*negundo Californicum*), complete the list of known forest trees of this province. 5. Of the caurine or north-western province, only Washington territory and Oregon above lat. 42° 30' belong to the United States. The abundant moisture of this region develops forest trees of immense height and girth, and though the number of genera is not as great as in the Appalachian province, there is a very considerable number of species. The evergreens predominate. The finest pines are further south, 3 species, only one of them of considerable size, being found N. of lat. 42° 30'; these are *pinus monticola*, *contorta*, and *ponderosa*, the last a noble yellow pine, tall, and having a dense heavy wood. The fir is at home in these northern mountains; 7 species are found here, one of which, the *abies grandis* or yellow fir, is the noblest of the tribe, though hardly surpassing in beauty the *A. amabilis* or Oregon silver fir. The Oregon white cedar (*thuja gigantea*), the Oregon yew (*taxus brevifolia*), and the north-western larch (*larix occidentalis*) are the only other evergreens. Two species each of willow and maple, one of alder, two of dogwood, two of manzanita (*arctostaphylos glauca* and *tomentosa*), and one each of ash, oak, hawthorn, crab apple, rhododendron, laurel, and chestnut, constitute the other known trees of this province within the limits of the United States. 6. The Nevadian province, extending from lat. 42° 30' to 32° N., is the home of the giant pines, cedars, and redwoods, trees of unparalleled size. The list of evergreen trees comprises 7 species of pine, viz., *pinus Sabiana* (California nut pine), *insignis* (western pitch pine), *blauana* (Newberry's nut pine), *Lambertiana* (the sugar pine), *Coulteri* (Coulter's nut pine), *muricata* (spiny shell pine), and *Torreyana* (Torrey's pine); 2 of *sequoia*, *S. sempervirens* and *S. gigantea*, or common and giant redwood; 3 of spruce, *abies Williamsoni* and *bracteata*; 6 of live oak, *quercus chrysolepis*, *agrifolia*, *densiflora*, *Hindsii*, *lobata*, and *acutident*; 3 of cypress, *cupressus Lawsoniana*, *macrocarpa*, and *Gowana*; the *juniperus pachyphloea*, or thick-bark juniper; the *thuja plicata*, or Mexican arbutus; the *oreodaphne Californica*, or mountain bay; and the *libocedrus decurrens*, or California cedar. Among the deciduous trees are 2 species of oak, *quercus Californica* and *Douglasii*; the *juglans rupestris* or Mexican walnut; and one species each of the buckeye, buckthorn, wild plum, redbud, sycamore (*platanus racemosa*), *Torreya*, dogwood, *ceanothus* (here a tree), cherry laurel, yucca, laurel sumach, alder, poplar, pistachio tree, &c. All these are peculiar to this province. 7. The Mexican province, including New Mexico, Arizona, and northern Texas, is divided into three distinct regions, rising in successive table lands from the low sandy desert to the Llano Escudo or Staked Plain and the plateaus of New Mexico. Except in isolated tracts, this province is not marked by an abundant forest growth, but the greater part of its trees are at least semi-

tropical in character. Six species of cactus, of 5 different genera, are found in the lowlands of this province, to which belong also 2 species of *Parkinsonia*, *P. microphylla* and *aculeata*, both known by the Mexicans and Texans as *paloverdes*; *Oleaya tesota*, *cercidium floridum* (green acacia), *Larrea Mexicana* (*hediondo*), and *schinus molle* (Peruvian pepper tree). On the first table land, that of the Llano Estacado and central Texas, the mezquite, *algarobia glandulosa*, and its congener, *strombocarpa pubescens*, with their deeply penetrating roots, their luscious honey-bearing pods, and their abundant gum, are the characteristic trees. In the Cross Timbers, and in small groves elsewhere, are also found *quercus oblongifolia*, the oblong-leaved live oak, *acacia Greggii*, *pinus edulis*, the New Mexican nut pine, and rarely the square-leaved juniper (*juniperus tetragona*), the California palm (*Brahea dulcis*), the Japote persimmon (*diospyros Texana*), and the Chihuahuan pine (*pinus Chihuahuana*). Still further north on the table lands of Arizona and New Mexico are found 8 species of oak, 2 of them live oak, viz., *quercus Emoryi*, *confertifolia*, and *Gambelli*, the last a white oak peculiar to Arizona. Along the river banks of this region the cottonwood is replaced by *fraxinus pistaciifolia* or Arizonian ash. Of shrubs the principal are the *rhus microphylla* or small-leaved sumach, and the *berberis Fremontii* or Arizonian barberry.—The character and quantity of forest vegetation is largely controlled by climatic influences. A humid climate, even if accompanied by low temperature, is favorable to the growth of forests, and hence we find northern Maine, New Hampshire, Vermont, and New York covered with immense forests. Where the cold is intense and the fall of rain moderate, the trees, except the hardiest, are killed by the deep frosts. The trees of these cold regions are for the most part evergreens, though some species of the oak, beech, &c., thrive. In the Appalachian region again, forests are more abundant on the eastern slope of the Alleghanies than on the western, and far more so than in the campestrian or prairie province, because the amount of rain is greater and the moisture more uniformly maintained. The clouds rising from the Atlantic are deprived of the greater portion of their moisture in their passage westward, and disappear in passing the Alleghanies. But for the great lake region of the north, which yields to the clouds a daily evaporation nearly or quite equal to $\frac{1}{4}$ of that of the north Atlantic, and the gulf of Mexico at the south, whose vapors are driven northward by the south winds, the Mississippi valley would form another desert like that of Gobi. As it is, the moisture was in many portions of the region insufficient to enable the forest trees to resist, as those of the Appalachian region have done, the frequent fires which proved so destructive to the dry herbage of the prairie lands. Along the western coast of North America we find forests of

gigantic growth on the seaward slope of the Cascade and Coast ranges, while eastward of those ranges we come to a treeless region, where fuel can only be procured from the deposits of coal, and where crops can only be produced by irrigation. Lying between this and the head waters of the western affluents of the Missouri and Mississippi, is a still more barren and verdureless region, where rain rarely falls, and where, except along the banks of streams fed by the melting of the mountain snows, but dry through a part at least of the summer, there is neither food for cattle nor fuel for the use of man. The cold of the mountain ranges has also something to do with the distribution of trees. At the height of 8,000 feet (under the general law that the mean temperature decreases 8 degrees for each 1,000 feet of elevation) we find plants whose place on the lowlands would be 2 or 3 degrees further north. Especially is this the case on the mountains of the Cascade range, where in some instances the trees of Russian America reappear on the higher slopes of the mountains of California and Oregon.—The grasses indigenous to the United States are very numerous, and some of them of great value. Botanists enumerate 71 genera and 261 species of native *gramineae*, including under this title some of the cereal grains and several species of maize, sorghum, sugar cane, &c. In the northern and middle states the cultivated grasses are mostly of European origin and naturalized; but in the southern, south-western, and western states, and in the region bordering on the great lakes, there are many native species fully equal to any of the European grasses. Among these are *zizania* or wild rice, of which there are 3 species found in the vicinity of the lakes and along the S. and S. W. bays, ponds, sounds, and river banks; *agrostis* or bent grass, of which there are 6 species and numerous varieties, the *A. alba*, var. *dispar*, or southern bent grass, being the one most highly esteemed; *stipa*, or oat grass; musquit grass, of which there are several species and many varieties, a native of Texas, and furnishing most delicious pasturage to the cattle and sheep of that region; *elymus* or sorrel grass; wild rye, a native of the gulf states, highly prized for a winter pasture; *poa compressa*, the blue grass, regarded throughout Kentucky and Tennessee as the best pasture grass known; *uniola*, wild oats or union grass, 4 species of which are natives of the southern states, and the *U. nitida* is highly prized; *paspalum*, of 21 species, of which several are valuable for grazing purposes; *cynodon dactylon*, Bermuda grass, a creeping grass on sandy soils, but very nutritious; and *arrhenatherum*, or oat grass, called also Oregon grass, Utah grass, &c., a native of the west and south-west, an excellent grass for hay, and much valued for grazing in winter.—Embracing a territory of such extent, the number and variety of flowering plants in the United States is very great. Each region has its flora, and

each season its characteristic blossoms. We can only glance at the most striking features of this floral display. In the north-eastern and middle states, the most noticeable of the flowers of early spring are the brilliant blossoms of some of the *compositæ*, and especially in the lowlands the bright yellow of the dandelion (*taraxacum dens-leonis*), and the purple flowers of the *geraniaceæ*, represented in that region by the *geranium maculatum*; a little later the dogwood (*cornus florida*) is in full blossom, the tree completely whitened with its creamy white flowers. The hawthorn, of which there are 14 or 15 species, is also one of the earliest of our native flowering shrubs, and its white blossoms are seen in all parts of the country. The delicate native primrose (*primula mistassinica* and *farinosa*) is less abundant, but of great beauty. A little later the native genera of the order *rosaceæ*, and particularly the wild roses and eglantines, as fragrant as beautiful, and the showy *Kalmia* or broad-leaved laurel, of the order *ericaceæ*, the *vaccinium* or blueberry, and the *Gaylussacia* or whortleberry, with their delicate pink and white flowers, as well as most of the fruit-bearing trees, are in full blossom. By the latter part of June the *umbellifera*, an order represented by some hundreds of genera and species, and the *crucifera*, numbering nearly as many, though of humbler pretension, have contributed their quota of flowers; to these are added the *ranunculaceæ*, or buttercup tribe, some of the genera of which indeed display their golden flowers in April and May. From July to October is the blossoming period of the great order of *compositæ*, though some of its most numerous genera do not mature their flowers till still later in the autumn. The *achillea* or milfoil; the more than 20 species of *coreopsis* with their yellow flowers; the coarse but brilliant *helianthus* or sunflower family, of which there are 25 indigenous species; and the *erigeron* or flea bane, with its purplish flowers, appear in great profusion in July, August, and September; as do also *scutellaria* (skullcap), *leonurus* (motherwort), and several other of the *labiata*, and the brilliant scarlet, crimson, and purple flowered lobelias. In October and November the neglected fields and roadsides are brilliant with the pink flowers of the *aster* and the nodding plumes of the *solidago* or golden-rod, two prominent members of the order of *compositæ*; and mingled with them are numerous less conspicuous flowers of the same or allied orders. In the region of the prairies the succession of flowers is somewhat different. The number of genera and species is smaller, but the varieties are almost endless. Among the earliest flowers are the pale blue *hepatica* and other of the *ranunculaceæ* of more brilliant colors, and almost as early the exquisite flowers of the *crataegus tomentosa* or black thorn, and the beautiful but scentless crimson rose of the prairies, *rosa setigera*. A week or two later the white and

peculiar flowers of the *podophyllum peltatum* or wild mandrake appear on the banks of the streams. In May and June the prairies are resplendent with flowers of all hues. The deep blue of *viola delphinifolia* (larkspur violet), the white, red, and purple of the *Houstonia*, and the variegated clusters of *Claytonia Caroliniana* and *Virginica*, appropriately named "spring beauty," with their hues of white, rose, red, and purple, blending with the rich golden yellow of the later *ranunculaceæ*, with occasional patches of other flowers or varieties of them differing only in color, make a western prairie an attractive object. Later in the season purple is the predominant color, though the dark hues of the *Heuchera* (alum root), the *liatris*, and the *eupatorium*, a species of boneset are relieved by the brilliant white of the *silene stellata*, and the rich sulphur yellow, with purple centre, of the *abelmoschus manihot*. Still later, as at the east, the *solidago* and *aster*, though of different species, maintain their superiority among the odorless flowers of autumn, though the native verbenas give some variety to the landscape. In the region extending from Carolina to Louisiana, we find flowers of a still different character. The *magnolia grandiflora*, the *azalea calendulacea* or pinxter bloom, and the *rhododendron punctatum* are the finest of the flowering shrubs: while the numerous species of *cleome* with their white and purple flowers, the golden blooms of the *hypericum aureum*, the bright scarlet of the *silene regia* or splendid catchfly, and the purple and carmine of the *hibiscus*, form a rich blending of colors. The hawthorn has its representatives here also; and though its modest flowers are not conspicuous among the more gorgeous semi-tropical flora, its fruit attracts attention from the brilliancy of its color. The southern states have no native rose, unless *rosa laevigata*, the Cherokee rose, usually said to have been brought from China, be really indigenous there. Two species of *spiræa* (hardhack), *S. corymbosa*, with its rose-colored corymb of flowers, and *S. aruncus*, with small racemes of whitish blossoms, are among the noticeable members of the order *rosaceæ* in that region. *Calycanthus floridus*, or sweet-scented shrub, remarkable rather for its exquisite fragrance than for the beauty of its flowers, is also a southern plant. *Eriotheca speciosa*, or evening primrose, is an elegant plant, with large white or roseate flowers, a native of Arkansas and Texas. Another flower of great beauty is the *passiflora incarnata* or passion flower, a native of North and South Carolina. The *Pinckneya pubens*, a singularly beautiful shrub of the order *rubiaceæ*, is a native of the coast from South Carolina to Florida and bears clusters of flowers of a delicate purple. There are numerous species of the *liatris* also in this region, with rich purple flowers. The coarse but brilliant lobelias and the asters and golden-rods make up their full share of the flowers of autumn. Their monotony is relieved by other

flowers equally showy and less coarse and weed-like in appearance. *Echinacea purpurea* or purple cone flower, *Rudbeckia triloba*, with flowers of deep purple and gold, and *helianthus radula*, with a dark purple disk and yellow rays, are among these. Texas has in many respects a different flora from any of the states E. or N. E. of it. The dogwood, of which there are several species, flowers in March, and the dwarf buckeye (*æsculus Texanus*) in the same month. These, however, are among the later flowers. *Houstonia cerulea*, called there bluets, puts forth its azure blossoms in January and February, and the white draba (*draba cuneifolia*) from the 1st to the 15th of February. Late in February or early in March, the formidable *yucca aloifolia*, or Spanish dagger, conceals its deformities with its abundant white and violet blossoms; the *phlox involu-crata*, or wood phlox, displays its rich carmine or purple flowers, and soon after its congener, *Gilia coronopifolia*, waves its scarlet plumes; *crataegus spathulata*, the Texan hawthorn, is also covered with its corymbs of white flowers; and the glossy deep green leaves of the black haw (*viburnum prunifolia*) contrast finely with its snow-white blossoms early in March. A little later come the various species of primrose, the purple lupines (*lupinus villosus*), and the *Krigia Caroliniana* or dwarf dandelion. Through April and May and into the earlier days of June these flowers with a few others continue to blossom; but the summer heats soon dry up vegetation except along the banks of the streams, the grasses protect their green leaves from the fierce and continuous heat by the thatch of dead grass which falls over them, and for two months nature dresses in russet. With the autumnal rains new flowers spring up. The order *compositæ* now predominates here as further north, but it is rather the *coreopsis*, *helianthus*, *silphium* or rosin weed, and *chrysopsis*, than the *solidago*, which make up the yellow blooms of autumn. Of *solidago* but a single species is known in Texas, and that not very abundant. A few species of the *aster* make their appearance, and the dahlia, a native of Mexico, finds its way across the border, but displays few of that infinitude of colors which careful cultivation has produced in the northern states and Europe. In the extreme west of Texas, along the Rio Grande, the cacti of the genera *opuntia*, *melocactus*, *cereus*, *mammillaria* (*grandiflora*, *flagelliformis*, &c.), conceal their rough and terrible thorns with the most gorgeous flowers. The region north of Texas, and extending through Arizona, New Mexico, Utah, and Colorado, is not prolific in flowers. *Artemisia* of 4 or 5 species, really a wormwood, though called by the hunters wild sage, and *senecio*, or fire weed, are the principal plants on the plains. The most remarkable flowers of the region are 2 species of *spiræa*, one, *S. dumosa*, a new species with beautiful plumes; a fragrant and elegant *anthera* (*cæ-pitosa*), or evening primrose, with large white

flowers; and *Cowanina Stanburiana*, *Houshara rubescens*, and *monothrix Stanburiana*, three new species of very singular appearance. The last named belongs to the order *compositæ*, and its flower possesses considerable beauty. The flora of California and Oregon is very abundant, and differs greatly in character from that of the country lying east of the Sierra Nevada or the Rocky mountains. Even where the same genera are found, the species are entirely different. There are numerous flowering plants of the order *scrophularia*, which are exquisitely beautiful. Among these are 2 or 3 species of *mirulus*, or monkey flower: *M. luteus*, with large and very showy flowers, yellow with spots of rose or purple; *M. cardinalis*, with brilliant scarlet flowers; and *M. moschatus*, or musk plant, with yellow flowers, and exhaling the odor of musk; and 2 species of *pentstemon*, or beard tongue: *P. speciosus*, with a rich blue flower, and *P. barbatus*, a bright scarlet flower. Of the *hydrophyllaceæ* there are 2 species: *nemophila insignis*, a white flower with a blue border, and *N. maculata*, white with violet-colored spots. Another exquisite flower of the order *polemoniaceæ* is the *Gilia tricolor*, with a limb of lilac blue, throat purple, and tube yellow. The indigenous plant in California, however, which in its season of flowering most attracts attention, is the *ribes speciosum* or flowering currant, whose large crimson racemes are unrivalled in beauty; a kindred species, *R. sanguineum*, is found in Oregon. A peculiarity of the flora of California is the almost entire absence of genera belonging to the two great orders *rosaceæ* and *compositæ*. The large genera of *crataegus* (hawthorns), *rosa*, *cerasus* (cherries), *prunus* (plums), *pyrus* (apples), and *rubus* (bramble), in the former, are scarcely represented at all; while in the latter we miss *aster*, *solidago* (golden rod), *coreopsis*, *helianthus* (sunflower), *erigeron* (flea bane), *chrysopsis*, *eupatorium* (boneset), &c. This deficiency is more than made up by the amplitude of some orders, such as *scrophulariæ* and *hydrophyllaceæ*. In general it may be said that the flora of the United States comprises few or none of the great staples of food; the cereals and all the esculent roots are naturalized, but many of them have been greatly improved by their transfer, and are now produced here of better quality than anywhere else in the world. The edible *cucurbitaceæ* (cucumbers, melons, squashes, &c.) are also all naturalized, as are most of the fruits, especially the apple, pear, plum, peach, quince, and apricot. The edible berries, such as the strawberry, blackberry, raspberry, whortleberry, bilberry, cloudberry, &c., are indigenous. The great fibrous staples too, cotton, flax, and hemp, are naturalized plants; while the agave, which possesses some qualities analogous to the last of these, is a native of the adjacent country of Mexico.—The zoology of the United States is essentially that of North America, nearly every species found on the North American

continent having its habitat in some part of the states or territories. The *quadrumana*, embracing the entire monkey tribe and its congeners, are wanting. Of the *cheiroptera*, or bat tribe, there are 3 genera and 11 species. Of the *sarcophaga*, or as they are frequently called *carnivora*, the largest is the cougar or catamount, often improperly called panther, which is not a native of this continent; he is a formidable animal, second in strength and ferocity among the *felida* to the lion and Bengal tiger. The wild cat or bay lynx, a smaller but ferocious creature, and the Canadian lynx, are the only other indigenous animals of the cat tribe. There are 6 species of the fox, and possibly 7, the common red, the cross fox (by some considered only a variety of the red), the black or silver, the prairie, swift, gray, and short-tailed fox. Of wolves there are 2 widely different species: the gray wolf of the wooded districts, a savage though cowardly animal, of which there are several varieties, known as the reddish, black, and giant wolf, but all apparently belonging to the same species (*canis occidentalis*); and the prairie wolf, the American representative of the oriental jackal. To the *digitigrada* also belong the pine marten or American sable, the American fisher, 2 species of mink, and the weasel and American ermine. Among the *plantigrada* we have the black bear, which is not uncommon in the wooded regions of the Atlantic states, and which, though reckoned a flesh-eater, subsists principally on honey, grain, berries, and fruits; the grizzly bear, the largest and most formidable of American carnivora; and possibly another species, hardly less in size, though of not quite so ferocious a temper, a native of the region west of the Rocky mountains, and known as the California bear. The remaining members of the order found here are the badger, the wolverene or glutton, 6 species of skunk, and the raccoon, of which there are 2 species, the common and the black-footed raccoon, the latter occurring only west of the Rocky mountains. Of the *pinnigrada*, or seal family, but one representative, the common seal, occurs on the United States coasts, though some of the other genera and species may rarely be drifted on icebergs to its northernmost limits. The *ruminantia* are represented in considerable numbers in the United States. Among the *cervida* or deer family we have the moose, now confined to the N. E. states, and very scarce even there; the wapiti, commonly but incorrectly called the elk; and 5 or 6 species of deer, known as the Virginian, Californian black-tailed, Columbian black-tailed, the long-tailed, and the mule deer, and possibly one or two other species. There is one and perhaps two species of antelope, the American prong-horn, a native of the Rocky mountain region, and a congener of the chamolais, being the one best known; and one of the sheep family, the big-horn or Rocky mountain sheep, found in the whole region of the Rocky mountains and Sierra Nevada. The bison, usually though in-

correctly called the buffalo, is the only wild representative of the ox family. Of the amphibious mammals, a singular species of the manatee or sea cow frequents the shores of Florida and the gulf of Mexico. The porpoise and 5 or 6 species of dolphin, among them the white fish or white whale, and the narwhal, are found along the coast; and the smaller species of whale are not uncommon, while the great sperm whale appears at some distance from the coast, but in the latitude of our possessions on the Pacific. The *insectivora* are represented by the mole, 3 genera and 7 or 8 species, and by 12 species of shrew mole, all of them belonging to the genus *sorex*. Among the numerous representatives of the great order *rodentia* in the United States are the beaver, 2 species of porcupine, 10 or 12 of squirrels proper, beside half a dozen of flying squirrels, 4 or 5 prairie squirrels, 2 prairie dogs, and the gopher or pouched rat, of which there are several species; the woodchuck or American marmot; the muskrat; the rat tribe, of which 3 genera and 3 or more species are indigenous, viz., the Florida or wood rat, the bush rat, and the cotton rat, and according to some also the roof or white-bellied rat, but this seems to be of European origin; the mouse tribe, including the common mouse, of which there are 4 genera and 19 or 20 species; the meadow mouse of numerous species; the lemming, of which there are at least 2; the hare or long-eared rabbit, of which there are at least 6 species; and the short-eared or true rabbit, of which there are 4 or 5. The *marsupialia*, which in Australia form so important a class of mammals, are in the United States represented by a single genus, the opossum, of which there are 2 species, one east and the other west of the Mississippi river.—Of birds the genera and species are so numerous, that only the more prominent can be named. Of the order *raptora* (birds of prey) the eagle, of which 5 species have been ascertained to exist in the United States, takes the first place. Next follow the vultures, of which at least half a dozen species inhabit the United States from the giant king vulture of California to the turkey buzzard and carrion crow of the eastern states; the hawks, of which there are not less than 25 or 30 species, including the falcon, king hen hawk, goshawk, sparrow hawk, &c.; and the owls, of which there are at least 40 species. The *scansores* or climbers are represented by the Carolina parrot, the only bird of the parrot tribe in the United States, and the woodpeckers, a well known genus, of which there are many species. The order *insectores*, formerly called *passerini* or *passores*, is very numerous in the United States, and includes the song birds as well as those distinguished by their cry or sharp shrill note. The most common members of the order are the thrush tribe, including the bird here called robin (a name which in Europe is bestowed on an entirely different bird), the mocking bird, and its hardly less skilful congener as a mimic, the cat bird:

the swallows, a numerous family; the finch tribe, which includes the sparrows; the kingfishers; the crow tribe; the orioles, noted alike for the beauty of their plumage and the variety of their song; the grackles or starlings; and, last and not least, but the most beautiful of all, the humming birds. The *rasores*, divided into the sub-orders *columba* and *gallina*, are also numerously represented. Pigeons and doves of numerous species are found in vast numbers in the wooded portions of the western and north-western states, and are not uncommon in any part of the Union. There are no true partridges in the United States, the partridge of the northern states being a grouse, and that of the southern states a quail; but the grouse, of at least a dozen species, quail, wild turkey, and several other species of gallinaceous birds occur in great numbers. Of the *grallatores* or waders we have the flamingo, several herons, the scarlet, white, and glossy ibis, the crane, the coot or mud hen, the rail, sandpiper, avocet, snipe, gray plover, &c. The *natatores* or swimmers are here a very numerous order. Of the *anserina* or geese there are about 20 species, including 2 species of swans; and of the *anatida* or duck family, at least 30. There are also 2 species of pelicans, confined to the gulf states, a great number of species of gulls, and half a dozen cormorants.—In reptiles the United States are less prolific than some other countries. There is a considerable variety of tortoises, though few of great size; and the keys or small coral islets along the coast of Florida, and the sandy spits along the shores of the southern Atlantic and gulf states, are frequented by the green and other sea turtles in great numbers. The alligator inhabits the rivers and bayous of the gulf states, and proves very destructive to cattle and small animals, sometimes, though rarely, attacking men. The saurians are abundant, especially in the southern states, and include a great variety of lizards (among others, the chameleon), skinks, horned frogs (*phrynosoma*), monitors or safeguards, &c. The ophidians or serpents are considerably numerous, but only 3 genera, the rattlesnakes, the moccasin snakes, and the vipers, are venomous. The black snake (*coluber constrictor*) is the only boa in the United States. The batrachians embrace numerous species of frogs, tree frogs, a horned frog (*ceratophrys*), 2 or 3 species of toad, the poroetus, siren, 3 or 4 tritons or newts, and about 20 species of salamander.—The number of genera and species of fish visiting or inhabiting the waters of the United States is too great to be fully enumerated. The most remarkable of the spine-finned are the pickerel, perch, mackerel, sword fish, and mullet. Among those with soft abdominal fins, the best known are the salmon, the shad, of which some varieties possess great excellence, the menhaden or alewife, the herring, pike, and carp; of those with soft fins at the throat, the cod, the fishery of which employs a very large force of men and furnishes food for many thousands, flounders,

flat fish, &c.; and of fish without ventral fins, several species of eels, both fresh and salt water fish, and the lamprey. The shark, of which there are 16 or 18 species, the ray or skate, of which there are 30 or 40, and the devil fish, are the most formidable of the monsters of the deep on the American coasts. Other fish well known and highly prized for the table are the halibut, tautog, blue fish, sea and striped bass, tomcod, porgy, &c.; and from the rivers and lakes, the perch, roach, dace, brook trout, lake trout, giant pike or muscalonge, and the delicious white fish of the lakes. Of mollusks, the *acephala* are widely distributed on the sea coast and through the lakes and rivers. The oyster of numerous varieties attains a flavor and excellence unknown elsewhere; the soft-shelled clam (*mya arenaria*) and the quahang or round clam (*Venus mercenaria*) are also much prized in some districts as articles of food. The pecten or scallop and the mussel are also edible species of bivalves. Others of the order are the cockle, hammer shell, razor shell, club shell, waterpot shell, and *teredo* or ship worm; and in the rivers the numerous species of *unio* and *anodonta*, usually called fresh water clams, are abundant. The pearl oyster has been found on the California coast, and several of the *unionida* secrete pearls of considerable value. There are many genera and species of land snails, and slugs, land soles, pond snails, limpets, whelks, ear shells, mitre shells, and others of the *gasteropoda*; and the Atlantic, Pacific, and gulf of Mexico wash upon our shores great numbers of the cephalopods which inhabit their waters, among them the nautilus, squid, *spirula*, sea spiders, &c. The *crustacea* are numerous, and many of them edible. Crabs, hermit crabs, lobsters, shrimps, horse-shoes or king crabs, &c., abound on the sea coast; and the fresh water lobster and land crab are found in the interior. The wood louse is common everywhere in damp places, and many of the parasitic insects belonging to this class are familiar to all. Of the *arachnida* there are in the gulf states some venomous species, as the scorpion and several species of spider; but for the most part the spiders, mites, &c., of the United States are harmless. The centipede, though properly belonging to the tropics, is occasionally found in the south-western states.—The insect tribes are too numerous to receive more than a passing notice. The beetles are very abundant, and include many genera. There are 22 species of locust, some of them destructive to vegetation, but none of them to be compared with the locust of oriental countries. The bee, wasp, hornet, and bumblebee, each of numerous species; the vast and beautiful tribe of butterflies; grasshoppers of many species and sometimes of great destructive power; the whole family of flies, among which, beside the house pests, we have a blistering fly nearly equal to the Spanish; and the other insect orders, all have their representatives; and as we approach the tropics their number and variety greatly in-

crease. The *annelida* have many representatives in the numerous worms which infest the country, some of them destroying the foliage of the trees, others penetrating the wood, others still the roots of trees and esculent vegetables. The leech, which inhabits marshy ponds, though not equal in power to the Swedish leech, is yet formidable from the loss of blood it occasions to those who expose themselves to its attacks, and occasionally fastens in such numbers upon cattle as to cause their death.—The domestic animals of the United States have been, with one or two exceptions, introduced from Europe. The horse, though not native to this continent, became wild at an early period, and now roams in large herds in the plains of Texas, but is domesticated without great difficulty. There have been at different times stocks introduced from England, France, Spain, and some from Morocco and Arabia; much attention has been paid to the breeding of these animals, and some of them have not been surpassed in speed or other good points. The asses are mainly from Spain and Malta; the cattle from Great Britain; the goats from the south of Europe, though some efforts have been made to introduce Asiatic species; and the sheep from the Southdown, Saxon, and Spanish Merino breeds. The swine are of various stocks; one breed, common in central and western Virginia and other mountainous districts, is tall, long, and gaunt, of ferocious nature and uncertain origin; but the most common breeds are the Berkshire (English) and Chinese, and crosses upon these. Our domestic dogs and cats are with few exceptions of European origin. The brown or Norway rat was an importation from the country whose name it bears, but has now been nearly destroyed by a more powerful and ferocious black rat, said to be from the south of Europe. Efforts have been made, but with no very satisfactory result, to introduce the llama of South America in our mountainous districts. The attempt to acclimate the Bactrian camel in Texas and California gives greater promise of success.—The republic abounds in natural curiosities and other objects of interest to travellers. Immense numbers of persons annually resort to the mineral springs, prominent among which are Stafford Springs, Conn.; Saratoga Springs, Ballston Spa, Avon Springs, New Lebanon Springs, and Sharon Springs, N. Y.; Brandywine Springs, Del.; the Red, White, and Blue Sulphur Springs and Sweet Springs, Va.; Warm Springs, N. C.; Hot Springs, Ark.; and Harrodsburg and Drennon Springs, Ky. The White mountains and Monadnock mountain in New Hampshire; Mt. Katahdin in Maine; Mt. Tom, Mt. Holyoke, and Wachusett mountain in Massachusetts; the Catskills, Adirondacs, and Alleghanies in New York; Schooley's mountain in New Jersey; and Pilot mountain and Mitchell's peak in North Carolina, are noted for their striking or picturesque scenery; while the great mountain ranges of the Pacific slope present innumerable scenes of unsurpassed

beauty and sublimity. Beside the great character of Niagara, there are several waterfalls worthy of particular notice, including the falls of the Connecticut at Bellows Falls, Vt.; Trenton Falls, in Oneida co., N. Y.; the falls of the Mohawk at Cohoes, N. Y., and of the Genesee at Rochester, N. Y.; the Katerskill falls on the Catskill mountains; the falls of the Passaic at Paterson, N. J.; of the Missouri in the N. W. part of Dacotah, the greatest on the continent after Niagara; St. Anthony's falls of the Mississippi, in Minnesota; and the 5 remarkable cascades in the Yosemite valley, Cal., one of which is said to be the highest known in the world. The most remarkable caves are the Mammoth cave in Kentucky; Madison's cave and Weir's cave, Virginia; Niojack cave, Georgia; and Fountain cave, near St. Paul, Minnesota. Not the least interesting among the picturesque features of the country are the remarkable channels cut by some of the rivers through ranges of hills or rocky ridges. Such are the passage of the Hudson through the highlands of New York; the Delaware Water Gap; the passage of the Potomac through the Blue ridge at Harper's Ferry; the "gates of the Rocky mountains" on the upper course of the Missouri in Dacotah; the deep canon of the Red river on the N. W. frontier of Texas; and the "cascades" where the Columbia river breaks through the Cascade range on the boundary between Washington territory and Oregon. The natural bridge of Virginia; the pictured rocks on the shore of Lake Superior in Michigan; and the popular seaside resorts, such as Nahant and Nantasket, Mass., Newport, R. I., Rockaway, N. Y., and Long Branch and Cape May, N. J., as well as nearly all the scenes above mentioned, are described in other articles. Among the most remarkable natural curiosities of the country must also be included the groves of enormous trees described in the article CALIFORNIA.—There is no other country in the world which contains a population composed of such heterogeneous elements as that of the United States. The character of the original settlers has left its impress to a certain extent upon their descendants, though in many parts of the country all such distinctive traces have been obliterated by the streams of subsequent immigration from all parts of Europe. In New England there is a strong remnant of the Puritan character; in Maryland the descendants of the English Roman Catholics, who came over with Cecil Calvert, are yet a prominent element of the population. New York obtained its first settlers from Holland, and in some remote villages of that state Dutch was not long ago the language of a considerable portion of the inhabitants. Delaware and New Jersey were first settled by the Dutch and Swedes; Pennsylvania by English Quakers, followed by many Germans, whose descendants form a numerous class of the population; North Carolina by nonconformists from Virginia. In South Carolina a large num-

ber of Huguenots found a home soon after its first settlement by whites. Louisiana, when purchased by the United States, was inhabited chiefly by French families. Texas and California are still to some extent Spanish, and the latter state contains 23,140 Chinese. The Mormons of Utah are mainly English, with a large admixture of native Americans, Welsh, Scandinavians, and other nationalities. In the other states the first settlers cannot be said to have transmitted any distinctive national traits to their descendants of the present day. In many parts of the newly settled north-west there is a large number of half-breeds or descendants of whites and Indians; but, beyond the perpetuation of numerous local names, the impress left upon the older and more thickly settled portions of the country by its aboriginal inhabitants is scarcely discernible. They have there nearly all disappeared, and the few that remain are chiefly gathered in small communities by themselves, more or less assimilated in modes of life to their white neighbors. In the extreme west they still form in many places the principal or sole population, and roam in all their primitive wildness. A few tribes, like the Apaches, Comanches, and Navajoes, are still openly or secretly hostile to the whites. In all cases where it has been practicable the Indians have been removed to "reservations" of land set apart for their use, and formerly secured in common to the tribe or part of a tribe which occupied them, according to their own system of land ownership. Since 1858, however, the plan has been adopted of granting titles in severalty to tracts of 40 to 80 acres to any Indians who would cultivate them, and among the more civilized tribes this has had a good effect. Whenever savage Indians can be induced to remove to reservations, the government pays them for the land they relinquish, and it has now invested for their benefit \$3,396,241, the interest of which is regularly paid them. They also receive small annuities from the United States. A part of the Cherokees, Creeks, and Choctaws, settled in the Indian territory, have adopted the customs of civilization, and are in some sort distinct nations under the protection of the United States. Exclusive of these, the Indians have 241 farms (6,112 acres) in cultivation, and own horses, mules, cattle, farming implements, and other personal property to the value of \$4,670,043. There are 77 missionaries and 162 schools among them, the latter having 5,950 pupils and 186 teachers. The management of Indian affairs is intrusted to a bureau of the department of the interior, under the charge of a commissioner. Negroes were introduced as slaves into all the colonies in their infancy, and the greater portion of those now in the country are still held as such in 15 of the 34 states, forming in some nearly or more than half the population. Their commingling with the dominant race has produced a numerous class of hybrids of all shades of complexion, known, according to their respective propor-

tion of African blood, as samboes, mulattoes, quadroons, octoroons, &c. The amount and condition of the African element of the population (classed indiscriminately as slaves and free colored) are exhibited in tables II., III., IV., and V. Table VI. shows the number and places of nativity of the foreign-born inhabitants of the United States in 1850, and their distribution among the several states. The number of native-born inhabitants of foreign parentage is not so easily determined. The corresponding statistics for 1860, not being yet collated at the census office, cannot be given in the present article. (See *EMIGRATION*.)—The development of the agricultural resources of the United States has not kept pace with the increase of the population. This is owing partly to the extraordinary growth of commerce and manufactures, which in many cases has built up large cities at the expense of the rural districts, and partly to improper methods of cultivation. Many of the older cultivated districts do not yield at present half as much as formerly, and some not a quarter as much. The falling off is easily checked by a judicious rotation of crops, and an application of a few of the simplest principles of agricultural chemistry; and the great and constantly increasing attention which has been paid to the science of farming for some years past, is gradually giving to the United States a rank as one of the most carefully tilled countries in the world. (See *AGRICULTURE*.) The greatest wheat-producing state is Illinois, after which in order come Wisconsin, Indiana, Ohio, Virginia, Pennsylvania, New York, Iowa, and Michigan. There has been for some years past a continual falling off in the productiveness of the wheat fields in the older states. The true wheat soils of the republic are found in the Atlantic states, excluding New England and the extreme south; and though large quantities of the grain are produced in localities far distant from these, it is almost exclusively of the inferior kind known as spring wheat. The prairie states yield enormously when the ground is first broken, but the soil wears out even sooner than that of the Atlantic states. The wheat crop of Ohio has diminished in 50 years from an average of 30 bushels an acre to an average of less than 15. Many portions of New York which once produced 25 bushels an acre now barely average 5. An English traveller in 1775 was amazed to find that the land around Albany yielded 30 or 40 bushels an acre, even with the most imperfect husbandry, while in England (where the average crop is now 36 bushels an acre) the best managed lands did not yield half so much. The average yield in Albany co. in 1855 was 4.68 bushels of winter wheat and 7.38 of spring wheat. From 1840 to 1850 the increase in the wheat crop of the whole United States was only 15,662,672 bushels, nearly all of which was supplied by Michigan, Indiana, Illinois, Wisconsin, Iowa, and Missouri. There was a small increase in the middle states, Virginia,

and the Carolinas, but in Kentucky, Tennessee, Ohio, and most of the other states, a very large decrease, showing that the old wheat regions were rapidly deteriorating. This is owing to the system of exhaustive cropping, the farmers preferring to work their land to its utmost capacity until it wears out, and then to remove westward, rather than to be at any expense for fertilizers or to practise a rotation of crops. From 1850 to 1860, however, the increase was 70,647,487 bushels, shared in different proportions by all the states except Maine, Vermont, New York, and Pennsylvania, which show a decrease. Ohio is almost stationary, with a very slight increase. Illinois stands first in the production of Indian corn, and next follow Missouri, Ohio, Indiana, Kentucky, Tennessee, Iowa, Virginia, Alabama, Georgia, North Carolina, and Mississippi. The greatest quantities of oats are raised in New York, Pennsylvania, Ohio, Illinois, Wisconsin, Virginia, Iowa, Indiana, Kentucky, New Jersey, Missouri, and Vermont; of rye, in Pennsylvania, New York, New Jersey, and Kentucky; of barley, in California, New York, Ohio, and Illinois; of buckwheat, in Pennsylvania, New York, and Ohio; of beans and peas, in Mississippi, North Carolina, Georgia, South Carolina, and New York; of orchard products, in New York, Ohio, Pennsylvania, and Indiana; of market garden products, in New York, New Jersey, Pennsylvania, and Massachusetts; of Irish potatoes, in New York (which produces more than any 3 other states), Pennsylvania, Ohio, Maine, Illinois, Michigan, Vermont, New Jersey, and New Hampshire; of sweet potatoes, in Georgia, North Carolina, Alabama, Mississippi, Tennessee, Louisiana, and Virginia; of hay, in New York, Pennsylvania, Illinois, Ohio, Maine, Vermont, and Wisconsin; of butter, in New York (which produces nearly twice as much as any other state), Pennsylvania, Ohio, Illinois, Indiana, Vermont, Michigan, Wisconsin, Virginia, and Missouri; of cheese, in New York (which produces more than twice as much as any other state), Ohio, Vermont, and Massachusetts; of rice, in South Carolina and Georgia; of wool, in Ohio, New York, Pennsylvania, and Michigan; of live stock, in New York, Ohio, Illinois, Pennsylvania, Kentucky, Tennessee, Missouri, Texas, and Indiana; of tobacco, in Virginia, Kentucky, Tennessee, Maryland, North Carolina, Missouri, and Ohio; of maple sugar, in New York, Vermont, Ohio, Michigan, and Pennsylvania. Cane sugar is grown largely in Louisiana, and to but little extent elsewhere. The only states that produce much flax are New York and Kentucky; and the only ones in which much hemp is grown are Kentucky, New York, and Missouri. New York is the principal seat of the hop culture. Wine is produced chiefly in Ohio, California, and Kentucky. The best cotton, the famous sea island variety, is raised in South Carolina, Georgia, and Florida. The greatest number of bales are produced in Mississippi, Alabama, Louisiana, Georgia, Texas, and Ar-

kansas, and the plant has also been cultivated with success in Illinois. In general it may be said that the middle and western states are most productive in wheat, rye, and oats; the southern and western in Indian corn; and the southern in rice. Wool and Irish potatoes are raised mostly N. of lat. 34°; tobacco between 34° and 41°; sweet potatoes S. of 40°; barley, apples, and pears N. of 38°; peaches S. of 41°; hemp, flax, and hops N. of 34°; cane sugar, oranges, figs, bananas, &c., S. of 33°.—In 1850 the number of farms in all the states and territories was 1,449,075, embracing 118,032,614 acres of improved, and 180,528,000 of unimproved land (in 1860, 163,261,389 acres improved, and 246,508,244 unimproved). The unimproved land consists of land that is occupied and necessary to the enjoyment of the improved, though not itself reclaimed; it does not include meadow. The value of farms was \$3,271,575,426 (1860, \$6,650,872,507), and of farming implements and machinery \$151,587,638 (1860, \$247,027,496); total, \$3,423,163,064 (1860, \$6,897,900,003); average value of farms, \$2,328; average value of farming implements and machinery, \$105; average value of farms, implements, and machinery, \$2,362. The average size of farms was 208 acres, the greatest average being in California (4,466 acres), and the smallest in Utah (51 acres). The greatest aggregate values of farms (\$554,546,642; in 1860, \$803,343,593), and of farming implements and machinery (\$23,084,926; in 1860, \$29,166,695) were in New York. The greatest average values of farms were in the District of Columbia (\$6,481), Louisiana (\$5,648), and New Jersey (\$5,030); and the smallest average values in Utah (\$337), New Mexico (\$441), and Arkansas (\$360). The average value of implements and machinery was greatest in Louisiana (\$863), where complicated processes are required for the production of sugar, and least in New Mexico (\$21), the next to the highest average being in New Jersey (\$186), and the next to the lowest in Maine (\$49). In the same year about $\frac{1}{3}$ of the whole area of the states and territories was improved, and $\frac{1}{4}$ more occupied but not improved, leaving about $\frac{1}{2}$ of the entire area unoccupied. The improved lands comprised in New England 26.79 per cent. of the whole; in the middle states 35.72 per cent.; in the southern states 16.07 per cent.; in the south-western states, exclusive of Texas, 10.17 per cent.; in the north-western states 12.90 per cent.; in California and the organized territories .06 per cent.; and in Texas .42 per cent. The average value of land per acre in New England was \$20.27; in the middle states \$28.07; in the southern states \$5.84; in the south-western states \$6.26; in the north-western states \$11.39; in California and the organized territories \$1.89; in Texas \$1.44. The proportion of improved land to the whole in the free states was 14.72 per cent.; in the slave states 10.09 per cent.; in the United States 7.71 per cent. The proportion of occupied land to the whole

in the free states was 28.56 per cent.; in the slave states 33.17 per cent.; in the United States 20.02 per cent. The average value of occupied land per acre in the free states was \$19; in the slave states \$6.09; in the United States \$11.14. The number of acres devoted to the different crops were: hay and pasturage, 33,000,000; Indian corn, 31,000,000; wheat, 11,000,000; oats, 7,500,000; cotton, 5,000,000; rye, 1,200,000; peas and beans, 1,000,000; Irish potatoes, 1,000,000; sweet potatoes, 750,000; buckwheat, 600,000; tobacco, 400,000; sugar, 400,000; barley, 300,000; rice, 175,000; hemp, 110,000; flax, 100,000; orchards, 500,000; gardens, 500,000; vineyards, 250,000; miscellaneous, 1,000,000. These figures leave 17,247,614 acres of land returned as improved unaccounted for. The largest average crop per acre of wheat was in Massachusetts, 16 bushels; the smallest in Georgia, 5 bushels; of rye, largest, Ohio, 25 bushels; smallest, Virginia, 5 bushels; of Indian corn, largest, Connecticut, 40 bushels; smallest, South Carolina, 11 bushels; of oats, largest, Iowa, 36 bushels; smallest, North Carolina, 10 bushels; of rice, Florida, 1,850 lbs.; South Carolina, 1,750 lbs.; Louisiana, 1,400 lbs.; of tobacco, largest, Missouri, 775 lbs.; of seed cotton, largest, Texas, 750 lbs.; of Irish potatoes, largest, Texas, 250 bushels; smallest, Alabama, 60 bushels; of sweet potatoes, largest, Georgia, 400 bushels. Of the whole number of 74,081 cotton plantations in the southern states on which 5 bales and upward were raised during the previous year, 16,100 were in Alabama, 15,110 in Mississippi, 14,578 in Georgia, 11,522 in South Carolina, 4,205 in Louisiana, 4,043 in Tennessee, 2,827 in North Carolina, 2,262 in Texas, 2,175 in Arkansas, 990 in Florida, 198 in Virginia, and 21 in Kentucky. Of 2,681 sugar plantations, 1,558 were in Louisiana, 958 in Florida, and 165 in Texas. Of 551 rice plantations on which 20,000 lbs. and upward of rough rice were produced, 446 were in South Carolina, 80 in Georgia, and 25 in North Carolina. Of 15,745 tobacco plantations on which 3,000 lbs. and upward of tobacco were raised, 5,987 were in Kentucky, 5,817 in Virginia, 2,215 in Tennessee, and 1,726 in Maryland. A detailed statement of the total agricultural production of the United States, as returned by the censuses of 1850 and 1860, is given in tables IX. and X.—The manufacturing industry of the United States dates from a period prior to their existence as an independent nation. Among the exports of the New England colonies and New York, until the English government forbade the sale of their manufactured products abroad from the fear of its competition with her home industries, were products of the loom, the forge, and the anvil, wrought with creditable skill, amid the most discouraging difficulties from the want of capital and machinery. The manufacture of iron was conducted on a large scale for many years before the revolution in Plymouth co., Mass., at Salisbury, Conn., near

Cold Spring on the Hudson, at Valley Forge, Penn., at Durham, below Easton, Penn., and at some other places. The necessity of iron for so many uses stimulated its manufacture after the colonies became independent; and though it was largely imported from Europe, the combination of skill and capital, and the known existence of superior ores, making the production of some qualities easier and cheaper there than here, there was a healthy and satisfactory growth in the production with each successive decade. In 1830 there were 239 furnaces, making 191,536 tons, which was converted into 112,866 tons of bar iron and 28,273 tons of cast iron; the whole having an aggregate value of \$13,329,760, and employing 29,254 hands. In 1837 it had risen to 250,000 tons. In 1850 the census report gave the production of pig iron as 563,755 tons, which was undoubtedly below the truth, as the local statistics of Pennsylvania alone the same year gave the number of tons produced as 564,575. The census of 1850 also reported as employed in the various branches of iron production and manufacture 60,285 persons, and aggregate products of over \$50,000,000. In 1856 the total production of iron had risen to 841,550 tons, of which 812,917 tons were pig iron. There was also imported the same year 488,998 tons of crude iron, making the whole amount used 1,330,548 tons. The manufacture of the domestic iron that year yielded products valued at \$47,771,286. The discovery of extensive deposits of very superior ore would have increased the production to a much greater extent, but for the competition of inferior qualities of foreign, which were admitted under a low duty. The pig iron produced during the census year ending June 1, 1860, is stated at 902,816 tons, valued at \$46,117,550; and 895,536 tons of rolled iron were produced, of the value of \$21,710,681; making the aggregate value of pig and rolled iron produced that year \$67,828,231. The pig iron is largely consumed by the manufacturers of stoves and hollow ware, which are produced in the United States in larger quantities than in any other country in the world.—The cotton manufacture was commenced in this country in 1790, although there had been some home manufacture of cotton goods prior to that time. In 1815 about \$40,000,000 of capital was invested in the business, 90,000 bales of 800 lbs. each consumed, 81,000,000 yards of cotton cloth produced, and nearly 100,000 operatives employed in its various processes. The progress of the manufacture had however been impeded by the large quantities of English cotton goods imported annually from Great Britain, where the invention of the power loom had cheapened the cost of production. The invention of a power loom in this country by Messrs. Sewell and Jackson, and its successful operation at Waltham in 1813, obviated in part this difficulty, and in 1822 the first cotton mill at Lowell was erected. The tariffs of 1824, 1828, and

1882 protected the manufacturers, and the production of cotton goods increased with great rapidity, while their price greatly decreased. In 1831 the number of cotton mills was 795, with 1,246,508 spindles and 38,506 looms, producing annually 280,461,990 yards of cloth, consuming 77,757,316 lbs. or 214,882 bales of cotton, and employing 18,539 men, 38,927 women, and 4,691 children; the annual value of manufactured articles was \$26,000,000, and the quantity of cotton goods printed was estimated at 40,000,000 yards. At this time there were no cotton mills south of Delaware. In 1840 there were 1,240 mills, with 2,284,631 spindles, and consuming 132,835,856 lbs. or 332,089 bales of cotton. The protective tariff of 1842 stimulated the business by checking importations, which however were again very large under the low tariff of 1846; yet in 1850, although the number of factories was reduced to 1,074, their total capacity was greatly increased, 641,240 bales of cotton of 400 lbs. each being consumed, and \$65,501,687 worth of goods produced. Of these manufactories, 218 were in the southern and western, and the remainder in the eastern and middle states. The tendency of the last decade was still further to the consolidation of this manufacture in a comparatively small number of establishments with large resources, but the production still continued to increase, and had reached in 1860 the amount of \$115,237,926; of the 915 manufactories, 192 were in the southern and western states. The scarcity and high price of cotton and the general depression of business consequent upon the civil war have since that date temporarily diminished the amount of production.—The woollen manufacture was carried on as a branch of home industry almost from the foundation of the colonies, but was not conducted in large establishments to any considerable extent till after 1810. In the census report of 1810, the value of woollen goods, almost entirely produced in families, was stated at \$25,608,788. In 1820 the large manufactories only were reported, and the production was \$4,413,068. In 1830 it had risen to \$14,528,166. In 1840 the amount of capital invested was \$15,765,124, the quantity of wool used 50,808,524 lbs., the number of persons employed 21,342, and the value of the manufactured products \$20,696,699. In 1850 the manufacturers of broadcloths had learned the art of dyeing them with fast colors, and this branch of the manufacture had received a very considerable impulse; the power carpet loom had also been invented, and our manufacturers were able to produce carpets equal in quality and superior in durability to the English. The number of manufacturing establishments in that year was 2,447, the capital invested \$26,811,467; 70,862,829 lbs. of wool were used, and the value of products was \$41,588,033. These totals do not include manufactures in which cotton and wool were combined. In 1860, as in the cotton manufacture, the num-

ber of establishments had been reduced by consolidation, being 638 less than in 1850; but the amount of capital invested in the business had risen to \$35,520,527, the quantity of wool used to 80,386,572 lbs., to which were added 16,008,625 lbs. of cotton for the mixed goods, and the value of the product to \$68,865,561.—The manufacture of leather was commenced very soon after the settlement of the colonies, being one of the class of manufactures well adapted to new settlements; and its progress has been steady and constant to the present time. The large tanneries have usually been situated in districts where the hemlock and oak abounded, for the sake of obtaining the bark used in tanning without too much expense of transportation. In 1850 there were 6,528 tanning and currying establishments in the United States, employing 22,575 persons; the capital invested was \$20,602,945, and the value of the leather produced \$37,702,333. The returns of 1860 are as yet incomplete, but the production of leather is stated at \$63,091,051. Almost the whole of this amount is consumed at home, the exports of leather in 1860 being only \$74,309. The manufactures of leather in 1850 were: boots and shoes, \$53,967,408; gloves, \$708,184; leather belting, \$105,500; morocco, \$3,861,896; patent leather, \$1,368,300; saddles and harness, \$9,935,474; total, \$69,946,761. The returns of these branches of manufacture for 1860 are not yet collated, but the increase in the production of boots and shoes, patent leather, leather belting, and saddles and harness is known to have been very large. The states which in 1850 produced the largest quantity of leather, each of them exceeding \$1,000,000, were Maine, Massachusetts, New York, New Jersey, Pennsylvania, Maryland, Kentucky, and Ohio. In 1860 the states of Maine, New Hampshire, Vermont, Massachusetts, New York, Pennsylvania, New Jersey, Maryland, Virginia, Tennessee, and Ohio, each produced leather to the value of more than \$1,000,000; and Massachusetts, New York, and Pennsylvania had each more than doubled their production of 1850. The states of Massachusetts, New York, and Pennsylvania alone produced more than two thirds of the whole amount. In 1850 Massachusetts was the largest producer of boots and shoes, manufacturing almost half the entire amount; the other states manufacturing over \$1,000,000 each were New Hampshire, Connecticut, New York, New Jersey, Pennsylvania, Maryland, and Ohio; and these states together produced about $\frac{2}{3}$ of the whole amount. The agricultural implements manufactured in the United States in 1850 were valued at \$6,842,610; in 1860, at \$17,802,514. In 1850 only one state (New York) manufactured more than \$1,000,000 worth of them, and only five, viz., Massachusetts, New York, Pennsylvania, Ohio, and Illinois, over \$500,000. In 1860 New York manufactured \$2,429,037; Ohio and Illinois each exceeded \$1,500,000, Massachusetts and Pennsylvania each

\$1,500,000; and Kentucky, Alabama, Wisconsin, and Indiana produced to the value of over half a million dollars each. Steam engines and machinery were produced in 1860 to the value of \$46,117,550; New York, Pennsylvania, Massachusetts, Ohio, New Jersey, Maryland, Virginia, Kentucky, California, Connecticut, and Rhode Island being the largest producers. The manufacture of flour in 1850 amounted to \$136,056,736 in value, employing 23,810 persons and a capital of \$54,415,581; and in 1860 the value had increased to nearly \$221,000,000. The production of lumber, which in 1850 was \$58,520,966, had increased in 1860 to \$93,651,000. The following branches of manufacture, which in 1850 produced the annexed amounts, have also greatly increased: bakers, \$18,294,229; blacksmiths, \$16,048,586; cabinet ware, \$17,668,054; calico printing, \$13,680,805; tallow chandlery, \$10,199,780; clothiers and tailors, \$48,811,709; coaches and carriages, \$11,078,680; distilleries, \$15,770,240; hats and caps, \$14,819,864; India rubber goods, \$3,024,335; firearms, \$1,178,014; musical instruments, \$2,580,715; nails, \$7,662,144; paper, \$10,187,177; pork and beef packing, \$11,981,642; printing and publishing, \$11,586,549; ship and boat building, \$16,595,683; quarry products, \$8,180,115; stoves and ranges, \$6,124,748; sugar refining, \$9,898,800; tin and sheet iron works, \$3,938,188; tobaccoists, \$13,491,147; white lead, \$5,242,218. The manufactures of plated ware, sewing machines, mowers and reapers, petroleum oils, gutta percha goods, shirts, &c., which do not appear in the returns of 1850, have attained a sufficient magnitude to merit a prominent position among the manufactures of 1860. In the annexed tables of manufactures (XI. and XII.) the statistics for 1860 are in many cases given in round numbers, the returns not having yet been fully revised, but are believed to be a near approximation to the actual results. The manufacturing statistics of the census of 1850 have never appeared in full; our statements for that year are taken from the "Abstract of the Statistics of Manufactures, according to the Returns of the Seventh Census," published by order of congress in 1859, except the quantities of goods produced, not found there, which are from the imperfect "Compendium of the Seventh Census," published in 1854. —The commerce of the colonies which afterward formed the United States early attained a considerable magnitude. In 1700 the exports of New England, New York, Pennsylvania, Virginia, Maryland, and Carolina amounted to about £395,000, and their imports to £344,000. In 1750 the exports of these colonies had risen to £813,000 and their imports to £1,812,000. In 1775 the exports were £1,920,000, while the imports, which in the previous year (1774) were £2,692,000, fell off under the prospect of the coming war to £196,000, and in 1776 to £55,400. During the war, and until the adoption of the constitution, trade languished, and

commerce was to a considerable extent suspended, owing to the jealousies of foreign states and the rivalry of the several members of the confederation. After the reorganization of the government under the constitution in 1789, it speedily attained respectable proportions. The tonnage, which in 1792 was 564,437, in 1801 had increased to 1,033,219; the imports, which in 1792 were \$31,500,000, in 1801 were \$111,863,511; and the exports had risen during the same period from \$20,753,098 to \$94,115,925. In 1807 the tonnage was 1,268,548, the imports \$188,500,000, and the exports \$108,848,150. At this point American commerce received a blow from which it did not recover for years; the "orders in council" of the British parliament, followed as they were by the "Berlin and Milan decrees" of Napoleon, and by our own embargo act in 1807, produced a terrible stagnation in our commerce; and though the amount of tonnage did not vary materially for the next 15 years, the imports fell off in 1808 to \$56,990,000 and the exports to \$22,430,960. The war of 1812-'15 furnished employment to some of the vessels which would otherwise have rotted at their wharfs, and led to the building of some war vessels and fast-sailing privateers; but the commerce of the country continued to decline till in 1814 it had fallen to \$12,965,000 imports and \$6,927,441 exports. The close of the war gave an extraordinary impulse to trade, and in 1815 the imports reached \$118,041,274, while in 1816 they rose to \$147,103,000; the exports of these two years were \$52,557,753 and \$81,920,452. From this amount of importation, which was excessive for the wants of the country at the time, there was a falling off the next year to \$99,250,000; and from that period to 1830, with the exception of 1818, the average of imports did not exceed \$78,000,000, and the exports were of about the same amount. From 1831 to 1837, the imports and exports rapidly increased, the former being \$189,980,035 in 1836, and the latter \$128,663,040. The revulsion of 1837, and the combined results of the bankrupt law, the change in the tariff, and the secondary effects of the great financial panic, reduced both imports and exports, which touched their lowest point in 1842. From that date the increase was gradual at first, but more rapid in the later years, up to 1860, when the exports were \$400,122,296, and the imports \$362,163,941. In 1858 there was indeed a considerable decline in consequence of the financial crisis of the previous year, but in 1859 and 1860 the deficiency was more than made up. The civil war in 1861 reduced both imports and exports far below the standards of the previous years. The principal exports of that year were as follows: products of the sea, including oils, whalebone, spermaceti, and fish dried, smoked, and pickled, \$4,451,515; products of the forest, including timber, lumber, shingles, staves, oak and other bark, tar, pitch, turpentine, resin, ashes, ginseng, skins, and furs, \$10,260,-

809; products of agriculture, beef, tallow, hides, horned cattle, butter, cheese, pork, bacon, lard, wool, domestic animals, the cereals, potatoes, apples, onions, rice, cotton (only \$84,051,483); tobacco, hemp, clover and flax seed, brown sugar, and hops, \$149,492,026; manufactures, \$33,356,115; coal, \$577,886; ice, \$172,268; gold and silver coin and bullion, \$23,799,870; quicksilver, \$681,450; articles not enumerated, manufactured, \$2,530,689; raw produce, \$2,794,046. The total exports of articles of American production amounted to \$228,699,486; of foreign articles, \$20,645,427; aggregate exports, \$249,344,913. The imports were reported under the tariff of 1857 till April 1, 1861, and after that date under the tariff of March 2, 1861, forming thus two separate schedules of great length; the whole amount was \$385,650,153. The most important items were: coffee, \$20,561,981; tea, \$6,882,089; gold and silver coin and bullion, \$46,889,603; copper in various forms, \$2,811,000; linseed, \$2,073,750; raw silk, \$1,411,000; unmanufactured wool, \$4,563,100; cotton goods, \$24,965,881; silk goods, \$23,715,729; linen goods, \$8,006,211; woollen goods, \$26,828,350; iron and steel manufactured and crude, \$16,468,008; sugar and molasses, \$34,773,649. Tables XIII. to XXVI. give detailed statistics of the imports and exports, tonnage, &c., of the United States for various periods. In 1854 a treaty was entered into between the United States and Great Britain for the reciprocal admission, free of duty, into the former and the provinces of Canada, New Brunswick, Nova Scotia, Prince Edward's Island, and Newfoundland, with the consent of their several legislative bodies, of certain specified articles, being the leading productions of those countries; the treaty to continue in force 10 years, and afterward until 12 months after notice given by either party of a desire to abrogate it. This treaty has greatly increased the commerce of the provinces, and opened greater facilities for bringing western produce to market. Table XXI. gives a general view of its operation.—The government early constructed several excellent macadamized roads, among which were the great national road from Baltimore through Wheeling, Cincinnati, &c., to St. Louis, and that from Bangor to Hamilton, Maine. The rapid extension of the system of railroads has rendered the further construction of these highways unnecessary; and during the year 1862 the question of the construction of some lines of railroad as military roads for government purposes was discussed, but it has not yet been attempted. An act was passed by congress, however, during the session of 1861-2, to aid in the construction of a railroad to the Pacific. The progress of railroad construction in the United States within the past 30 years has been unexampled in its rapidity. In 1832 there were 181 miles in actual operation. From 1832 to 1842, 8,746 miles additional were constructed; from 1842 to 1852, 7,001 miles; and from 1852 to 1862, 22,820

miles. The present extent and cost of the roads in the United States are shown in the following table:

States.	Jan. 1, 1862.	Jan. 1, 1862.		Cost of rail and equip.
	Miles open.	Miles open and under construction.	Miles open for traffic.	
Maine	253	639.78	449.56	\$18,901.87
New Hampshire ..	403	684.29	657.88	22,512.22
Vermont	369	675.67	665.07	22,384.76

California	348.23	70.05	1,004.00
Oregon	3.80	3.80	0.00
Total	10,900	51,114.92	38,222.37	\$1,182,406.43

In the article CANAL will be found a table of the canals of the United States, with their length, cost, cost per mile, width, depth, size of locks, and tonnage of boats which they will admit. There were at that time (1862) 3,184 miles of canals completed, and the entire cost somewhat exceeded \$90,000,000. Since that date the enlargement of the Erie and Champlain canals in New York has been completed, the Virginia canals extended, and the Illinois enlarged. The total expenditure up to the present time is not less than \$100,000,000. A project was discussed in congress in 1863 for enlarging the Erie, Champlain, and Illinois and Michigan canals at the expense of the national government, so as to admit the passage of gunboats from the Hudson and the Mississippi to the great lakes. It was finally postponed to the next session. The length of magnetic telegraph lines in the United States in 1863 was between 50,000 and 60,000 miles, and includes a line extending across the continent to San Francisco, Cal., and Portland, Oregon; while active measures are in progress to connect this with one from St. Petersburg to the mouth of the Amoor, which will give as an uninterrupted communication with Europe through Asia. (See TELEGRAPH.)—The public institutions of the United States of a benevolent, charitable, literary, or scientific character are numerous, but are mostly organized under state charters and described under the

several states. Among the few which are strictly national in character, are the Smithsonian institution, founded at Washington in 1846 under the bequest of James Smithson; the national observatory, also at Washington, for the promotion of astronomical and meteorological science; and the "American Association for the Advancement of Science," a convention of the cultivators and friends of physical and mathematical science, which holds annual or semi-annual sessions in different cities, and publishes annual volumes of "Transactions." There are also many national associations for the advancement of education, religion, benevolent purposes, and different branches of the arts and sciences.—Education in the United States is very generally diffused. The number of native inhabitants of the New England states who cannot at least read and write is very small. In the middle states the large influx of foreign population, a considerable proportion of whom are indifferent to the education of their children, has made the proportion of uneducated persons somewhat greater. In the southern or planting states, the population is too widely scattered to admit of successful public schools except in the cities, and the larger part of the non-slaveholding whites have had but few opportunities of education; while in most of these states it is by local law a penal offence to teach the negroes to read. In the western states ample provision is made for elementary education. In all the new states one, and in some of them two sections of land (each of 640 acres) in each township of government lands are reserved for school purposes, and the states have also grants of swamp and other lands for school funds and for the establishment of state universities. The people generally appreciate the advantages of this elementary education, and great sacrifices are often made to establish and maintain good and accessible schools. That these schools, even in those states which are furthest advanced, are as efficient or thorough in their instruction as they should be, is not probable; but they have made very great improvement within the past 20 years, and are still advancing. In what is sometimes styled secondary education, embracing a very wide range, from the select school or village academy, which is often mainly occupied with rudimentary studies, to the high school, institute, seminary, or collegiate school (so called), the number of schools is in the older states sufficiently large, though in many of them the instruction might be improved. In several of the northern states the tendency is to the organization of graded schools, the public schools of a town or village being arranged so as to have one or more high schools, equal in their course of instruction and teaching to the best academies, three, four, or more grammar schools, and a still larger number of intermediate and primary schools, all supported by tax on property and the allowance from the school fund. The pupil, entering the primary

school at 5 or 6 years of age, may pass by successive examinations to the highest department; and there being no charge for tuition, the child of the poorest citizen enjoys the same opportunities of education, up to the completion of the high school course, as the child of the rich. In some of the states this system is carried still further by the organization of free state universities. The greater part of the secondary instruction is, however, imparted in incorporated or private seminaries, academies, institutes, or collegiate schools, the price of tuition varying with the location, reputation, number of teachers, &c. In many of these the pupils board and lodge either in the family of the principal or in a boarding house connected with the school. Most of these schools are well conducted, and impart a very thorough and judicious course of instruction. The number of colleges in the United States in 1861 was about 180. They differ greatly in the extent and thoroughness of their course of instruction, some being little more than academies giving an elementary course in mathematics and classics, while others are nearly equal to the best classical schools of Europe in their requirements. A few are universities, having connected with them departments for professional or scientific study, well supplied with the means of imparting instruction in law, medicine, theology, physical science, mathematics, &c. Several of the states have state universities, or institutions bearing that name, though not yet fully organized, but there is no national university. Most of the colleges, including some of the best, were founded and are maintained mainly by particular religious denominations. There are nearly 60 theological schools and seminaries, of which 20 are connected with colleges or universities and the remainder independent; about 24 law schools, of which 16 are connected with colleges or universities; about 50 medical schools, of which nearly one half are departments of universities or colleges; 10 or 12 scientific schools, of which only 3 are as yet connected with universities, viz.: the Lawrence scientific school, at Cambridge, Mass., with Harvard university; the Sheffield scientific school, at New Haven, Conn., with Yale college; and the Chandler scientific school, at Hanover, N. H., with Dartmouth college. One has also been projected in connection with Union college, Schenectady, N. Y. The following statistics and estimates of the number of pupils and cost of instruction in private schools, high schools, academies, and boarding schools, and the results of the latest returns of colleges and schools of higher instruction, will give an approximate idea of the magnitude of the educational interest in the United States. The estimates of the number, attendance, and expense of the private schools and schools of higher grade are deduced from a careful examination of the published returns from 8 widely separated states, and are believed to be below the truth:

Institutions.	Number.	No. of pupils.	Annual expenditure per pupil.	Total expenditures.
Private schools, high schools, and academies.	17,000	510,000	\$15*	\$7,650,000
Boarding schools.....	1,150	57,500	150	8,625,000
Colleges.....	180	15,515	161	2,440,293
Theological institutions..	58	1,579	150	244,270
Law schools.....	23	1,409	200	281,500
Medical schools.....	45	5,490	200	1,098,000
Institutions for blind, deaf and dumb, and idiots...	50	7,517	150	1,127,550
Scientific schools not connected with colleges...	99	1,968	200	241,600
Total.....	18,476	600,206	\$21,705,518
Add expenditure for common schools.....				21,186,624
Aggregate annual expenditure for educational purposes.....				\$42,892,140

Table XXXI. gives the statistics of colleges, academies, and common schools, as returned by the census of 1850; and table XXX. the statistics of common school education for 1860, derived from other sources, the census returns for that year not being yet available. In the other accessories, of superior education, such as libraries, popular and scientific courses of lectures, scientific journals, &c., the United States, though necessarily far behind the older states of Europe, have made great progress within a few years past. There are 8 public libraries containing more than 100,000 volumes each, 10 containing over 50,000 volumes, and 20 containing over 30,000. There are no lecture foundations or endowments in the country, except that of the Lowell institute in Boston, the Graham lectures in Brooklyn, N. Y., and the Smithsonian course in connection with the Smithsonian institution at Washington; but in almost every city or large village courses of lectures, some of them scientific, others popular and amusing, are delivered every year, and attended by large numbers. The scientific journals receive no assistance, like many of the European scientific publications, from the government; they are ably conducted and well supported, and some of them have a high reputation in Europe as well as at home.—The press exerts a more powerful influence in the United States than in any other country; the greater part of the people read, and most families take at least one newspaper, and many take several, beside magazines. The leading journals, daily or weekly, political, literary, or religious, having a large circulation, and a consequently large advertising patronage (if, as is usually the case, they admit advertisements), can be afforded at a low price and still expend liberal sums in the remuneration of editors, reporters, contributors, and correspondents; and the result is seen in the high literary character of many of them. The religious newspaper press of the large cities is superior to that of any other country, both in its literary merits and its dignity of tone. There is also a local newspaper

press, which exerts in the aggregate a powerful influence. There are few villages of 1,000 inhabitants in the country which do not support a local newspaper, edited it may be in ignorance with no great ability, yet sufficing for the expression of local sentiments, for the development of local talent, and occasionally forming the mouthpiece of some vigorous and cultivated intellect which seeks through it to address the community it represents. The number of newspapers in 1850 was 2,526; in 1860, 3,951. Even the most newly settled states have a greater number than would be supposed possible, California having 99 in 1859, and Texas 56 in 1860. Table XXXIV. shows the number, character, and circulation of the newspapers and periodicals of the United States in 1850 and 1860.—There is no established or state church in the United States. The most numerous denomination, as appears in the tables, is the Roman Catholic, the membership of which, unlike the Protestant denominations, includes nearly the whole population attending upon its worship. It has some churches in every state, but is found chiefly in New York, Pennsylvania, Ohio, Maryland, Kentucky, Louisiana, Missouri, Indiana, Massachusetts, Iowa, Wisconsin, New Mexico, and California. But a small proportion of the Roman Catholics, however, are of American parentage, most of them being Irish, French, and German immigrants, and their immediate descendants. The next in numbers are the Methodists, who are divided into several bodies, holding in general nearly the same doctrines, but differing either in their views on the subject of slavery, or in their ideas of church government, lay representation, itinerancy, &c. There is a small number of churches, some of them composed mostly of Welsh and their descendants, which, while holding Calvinistic doctrines, adhere to the Methodist church polity, and are known as Calvinistic or Congregational Methodists. The Methodists are the leading denomination in the middle, southern, south-western, and western states, and perhaps also in the Pacific states and the territories; and in New England they occupy either the second or third rank. The Baptists are next to the Methodists in numbers, and they too are divided into several denominations. The regular or restricted communion Baptists are by far the most numerous, and occupy the second rank in numbers in the southern, south-western, and western states, and perhaps also in New England. The Freewill Baptists are confined to the northern and north-western states, and are most numerous in Maine, New Hampshire, Michigan, Wisconsin, and Iowa. The Seventh Day Baptists and the Six Principle Baptists are mostly confined to Rhode Island, Connecticut, and New York. The Church of God, or Winebrennarians, differ but slightly from the regular Baptists; they are found principally in Pennsylvania. The Mennonites are confined almost exclusively to Pennsylvania, Ohio, Virginia, and New York. The

* For tuition only.

Dunkers or Tunkers are found in the same states. The "Disciples," or followers of Alexander Campbell, also practise immersion, but are not usually reckoned among the Baptists; they are found mostly in Virginia, Kentucky, Ohio, Pennsylvania, Indiana, Illinois, and Tennessee. The Presbyterian bodies come next in numbers. The largest and wealthiest is the Old School Presbyterian church, which has its largest membership in the middle, southern, and south-western states. The New School Presbyterians are found chiefly in the middle and western states, and the Cumberland Presbyterians in the south-western states. The Protestant Reformed Dutch church flourishes principally in New York and New Jersey; the German Reformed church in Pennsylvania, Maryland, North Carolina, and Ohio; and the Lutherans, consisting mostly of German, Swedish, and Danish immigrants, in Pennsylvania, Ohio, New York, North Carolina, South Carolina, Virginia, Maryland, Indiana, Illinois, Missouri, and Wisconsin. The Protestant Episcopal church, though having a smaller number of communicants than most of those previously mentioned, is a prominent and influential denomination. In New York, Philadelphia, and perhaps some other of our larger cities, its congregations are more wealthy than those of any other denomination. Before the revolution it was the established church of New York and Virginia; and it is still one of the leading denominations in those states, as well as in Maryland, Connecticut, and Pennsylvania. The Congregationalists are divided into two bodies, the Orthodox or Trinitarian and the Unitarian Congregationalists. The former are the leading denomination in the New England states, and have a considerable number of churches in New York and in each of the western and Pacific states, but very few in the other middle or the southern or south-western states. The Unitarian Congregationalists are most numerous in Massachusetts, but have some congregations, mostly in the cities and larger towns, in Maine, New Hampshire, Vermont, Connecticut, New York, the District of Columbia, Maryland, Virginia, South Carolina, Alabama, Louisiana, Missouri, and California. The denomination taking the distinctive name of Christians, having their largest numbers in Tennessee, Kentucky, Ohio, Indiana, Missouri, and New York, but found in nearly all the other states, may be described as Unitarian Baptists, with a church government somewhat resembling that of the Methodists. The Universalists are mostly in the New England states, New York, Pennsylvania, Kentucky, Ohio, Michigan, Indiana, Illinois, and Wisconsin. They are divided into two bodies, the Restorationists and the Universalists proper, whose comparative numbers are not known. The Friends or Quakers are divided into two bodies, the Orthodox or Trinitarian, and the Hicksite or Unitarian Friends. Of late years a large number of persons have become believers

in the phenomena known as spiritual manifestations or communications, and in many instances have formed themselves into congregations for religious worship in accordance with the views promulgated by so called spiritual mediums. These organizations, however, include but a small part of those who have become more or less attracted by spiritualism, and hence it is impossible to give any estimate of their actual numbers. Of the minor sects not affiliated with the leading denominations, we may name the Moravians or "United Brethren in Christ," principally found in Ohio, Pennsylvania, and Indiana; the New Jerusalem church, or Swedenborgians, in Massachusetts, and in most of the large cities of the country; the Shakers, who have communities in 5 or 6 states; and the Mormons, mostly in Utah territory, where they form an isolated community. Jewish congregations exist in most of the larger towns of the Union, consisting in large part of immigrants from Germany and Poland. The most important are those of New York, Philadelphia, Baltimore, Cincinnati, San Francisco, New Orleans, and Charleston. The salaries of the clergy are generally sufficient for their support, and even in the smallest villages or rural districts materially exceed those of a large proportion of the country curates of England, the priests of the smaller communes of France, or the lowest class of the clergy of Germany, Switzerland, and Denmark. The average salary of Congregational and Presbyterian ministers is said to be \$700; of the Reformed Dutch and Episcopal clergy, about \$600; of Baptist ministers, about \$500; of Methodist ministers, \$400; and of the Roman Catholic clergy, \$500. Table XXXII. gives the number of churches, value of church property, and other statistics of the churches of each denomination in each state, as returned by the census of 1850. Table XXXIII. gives the number of churches, ministers, and members of the principal denominations at dates near Jan. 1861. —The several states of the Union, so far as their internal affairs are concerned, are sovereign and independent, while for the common interests of all they delegate a portion of their powers to a central government, whose edicts and laws, so long as they are not in conflict with the constitution, are paramount to state authority. All powers not expressly granted by the constitution to the federal government, nor prohibited by it to the states, are reserved to the states respectively or to the people. The government consists of three branches, the legislative, executive, and judicial. The executive power is vested in a president, who together with a vice-president is elected for 4 years by a college of electors, appointed in each state as the respective legislatures may direct, each state returning as many electors as it is entitled to have senators and representatives in congress. In South Carolina the electors are chosen by the legislature; in all the other states by popular vote. In case of the removal,

death, resignation, or inability of the president, the vice-president succeeds to the presidency; and in case of the failure of both president and vice-president, congress has authority to declare what officer shall act as president until the disability be removed or a president shall be elected. By act of congress approved March 1, 1792, the president of the senate *pro tempore*, or in case there be no president of the senate, the speaker of the house of representatives, is to act as president in such a case. The latter contingency has as yet never occurred, and the former only in two instances, viz., on the death in office of Presidents Harrison (1841) and Taylor (1850). When there is no election of president by the people for want of a majority of electoral votes for any one candidate, the house of representatives chooses the president from the three having the highest number of votes, the body of representatives from each state casting a single vote. Two elections by the house have occurred, viz.: in 1800 (under the original provision of the constitution, which required that the highest candidate should be president and the next highest vice-president), when, there being a tie between Thomas Jefferson and Aaron Burr, the former was chosen president by the house; and in 1824, when John Quincy Adams was chosen. The president, as well as all other civil officers, may be removed from office on impeachment for and conviction of treason, bribery, or other high crimes and misdemeanors. He is commander-in-chief of the army and navy, and of the militia of the several states when they are called into the actual service of the general government; and has power, by and with the advice and consent of the senate, to make treaties, and to appoint ambassadors, and other public officers of the United States whose appointment is not otherwise provided for. He receives a salary of \$25,000 a year, and the vice-president \$8,000. All acts of congress must be presented to him before they can become law, and he may within 10 days from its presentation return any bill of which he disapproves to the house in which it originated, stating his objections. If on reconsideration the bill is again passed by two thirds of each house, it becomes law. The president must be a natural-born citizen, 35 years of age, and 14 years a resident within the United States. He is assisted by a cabinet of 7 ministers, called the secretaries of state, of the treasury, of the interior, of the navy, and of war, the attorney-general, and the post-master-general, who are nominated by him and confirmed by the senate. They receive \$8,000 a year each. The national legislature consists of a congress composed of a senate and house of representatives. The senate consists of 2 senators from each state chosen by the respective legislatures for 6 years, in such a way that one third of the whole body goes out of office every 2 years. The vice-president of the United States is president of the senate *ex officio*, and in his absence the senate elects a

president *pro tempore*; he has only a casting vote. A senator must be 30 years of age, 7 years a citizen of the United States, and at the time of his election a resident within the state for which he is chosen. The senate has power to try all impeachments. The house of representatives is composed of members chosen for 2 years by the people of each state; they must be 25 years of age, 7 years citizens of the United States, and at the time of their election residents within the states for which they are chosen. The number of representatives in congress is fixed by law at 233, and they are apportioned among the several states according to their representative population, which is ascertained by adding to the number of free persons, including persons bound to service for a term of years, and excluding Indians not taxed, $\frac{3}{4}$ of all others (i. e., slaves). Every state is entitled to at least one representative. New states admitted after the apportionment (which is made after each decennial census) elect representatives in addition to the limited number of 233, but such excess continues only till the next apportionment. There are also delegates, one from each organized territory, who are entitled to speak in the house, but not to vote. Table VI. shows the number of representatives to which the several states were entitled under the apportionments of 1850 and 1860. The house of representatives chooses its own speaker and other officers; has the sole power of impeachment; and originates all bills relating to revenue. Members of both senate and house receive \$6,000 for each congress (\$3,000 a year), and mileage at the rate of \$3 for every 20 miles of travel in the usual road in going to and returning from the seat of government. The pay of the speaker of the house and of the president of the senate *pro tempore* is \$12,000 a congress. The regular sessions of congress commence on the first Monday of December in each year, and extra sessions may be called by the president whenever he deems it necessary. The term of office of representatives, and consequently the duration of each congress, expires by law on the 4th day of March of every second year. Congress has power to lay and collect taxes, imposts, and excises, which must be uniform throughout the United States; to borrow money on the credit of the United States; to coin money; to define and punish piracy and offences against the law of nations; to declare war; to raise and support an army and navy; to provide for calling forth the militia when required; and to exercise exclusive legislation in all cases over the District of Columbia. Congress can make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech or of the press, or the right of the people peaceably to assemble and to petition the government for a redress of grievances. —The judiciary comprises a supreme court with one chief justice (salary \$6,500) and 8 associate justices (salary \$6,000 each), appointed for life

by the president, by and with the advice and consent of the senate, and holding one session annually in Washington. The supreme court has jurisdiction in law and equity in all cases arising under the constitution, the laws of the United States, and treaties; cases affecting ambassadors, other foreign ministers, and consuls; cases of admiralty and maritime jurisdiction; controversies to which the United States may be a party; controversies between a state and citizens of another state, between citizens of different states, between citizens of the same state claiming lands under grants of different states, and between a state or the citizens thereof and foreign states, citizens, or subjects. In all cases affecting ambassadors, other public ministers, and consuls, and those in which a state is a party, it has original jurisdiction; in all the other cases before mentioned, the constitution gives it appellate jurisdiction, subject to such restrictions as congress may prescribe. By the act of Sept. 24, 1789, it has exclusive jurisdiction of all civil controversies to which a state is a party, except between a state and its citizens, and also except between a state and citizens of other states or aliens, in which latter case it has original but not exclusive jurisdiction. It has exclusive jurisdiction of all such suits or proceedings against ambassadors or other public ministers, or their domestics or domestic servants, as a court of law can have consistently with the law of nations; and original but not exclusive jurisdiction of all suits brought by ambassadors or other public ministers, or to which a consul or vice-consul may be a party. By the 11th amendment to the constitution the judicial power of the United States must not be construed to extend to any suit in law or equity commenced or prosecuted against any one of the United States by citizens of another state, or by citizens or subjects of any foreign state. The supreme court exercises appellate jurisdiction by writ of error or appeal from the final judgments of the circuit courts, of the district courts exercising the powers of circuit courts, and of the superior courts of the territories exercising the powers of circuit courts in certain cases. It has also appellate jurisdiction by writ of error from the final judgments and decrees of the highest courts of law or equity in a state in certain cases where there is question of the validity of a treaty, or of a statute of or authority exercised under the United States; or of the constitutionality of a statute of or an authority exercised under any state; or of the right construction of a clause of the constitution, treaty, or statute of or authority exercised under the United States. It has likewise jurisdiction in civil and criminal cases by certificate from the circuit court that the opinions of the judges are divided on points stated. The circuit courts are composed each of a justice of the supreme court and a judge of the district court in the district in which the court is held. The United States are divided into 9

judicial circuits, in each of which a court is held twice every year for each state within the circuit. As reorganized by act of congress in 1862, the circuits are constituted as follows: 1, Maine, New Hampshire, Massachusetts, Rhode Island, and Connecticut; 2, New York and Vermont; 3, New Jersey and Pennsylvania; 4, Delaware, Maryland, Virginia, and North Carolina; 5, South Carolina, Georgia, Florida, Alabama, and Mississippi; 6, Louisiana, Texas, Arkansas, Kentucky, and Tennessee; 7, Ohio and Indiana; 8, Michigan, Illinois, and Wisconsin; 9, Minnesota, Iowa, Missouri, and Kansas. There is also a circuit court in the District of Columbia, established by a particular act of congress, and composed of a chief justice and 2 associates; and the state of California is constituted as an extra circuit, with a judge who is not a justice of the supreme court. The circuit courts have original jurisdiction (provided the matter in dispute exceeds \$500) in cases arising under the patent laws; suits on contracts brought by the United States; suits at common law where any officer of the United States acts under authority of an act of congress; bills in equity filed by the United States against the debtor of their debtor; civil controversies between a citizen of the state in which the suit is brought and a citizen of another state; civil suits to which an alien is a party; controversies between citizens of the same state claiming lands under grants of different states, &c. They have appellate jurisdiction from the district courts under certain regulations, the appeals taking place generally in civil causes of admiralty or maritime jurisdiction. In equity they have, by the act of Sept. 1789, original cognizance concurrent with state courts of suits of a civil nature where the matter in dispute exceeds, exclusive of costs, \$500, and the United States are plaintiffs or petitioners, or an alien is a party, or the suit is between a citizen of the state where it is brought and a citizen of another state. In criminal matters the same act gives the circuit courts exclusive cognizance of all crimes and offences cognizable under the authority of the United States, except where that act otherwise provides or the laws of the United States shall otherwise direct; and concurrent jurisdiction with the district courts of all crimes and offences cognizable therein. The United States are also divided into 50 districts, in each of which there is a court called a district court, composed of one judge who is to reside in the district for which he is appointed. These courts have civil jurisdiction in admiralty and maritime causes, including prize suits, cases of salvage, and seizures under the laws of impost, navigation, or trade of the United States; cases of seizure on land under the laws of the United States; suits for penalties and forfeitures under the laws of the United States; cases in which an alien sues for tort in violation of the laws of nations or of a treaty of the United States; suits instituted by the United States;

actions by and against consuls; and certain cases in equity. They have criminal jurisdiction, concurrent with the circuit courts, of all crimes and offences against the United States the punishment of which is not capital. Courts are established by the United States in each of the territories, their constitution and functions being prescribed by the act of congress organizing each territory. In general they assimilate closely to the various state courts. There is also a court of claims composed of a presiding judge and 2 associate judges (salary \$4,000 each), which holds its sessions in the capitol at Washington. All the other courts are established by the authority of the several states, and their organization differs according to the state laws. The trial of all crimes, except in cases of impeachment, must be by jury.—The constitution forbids the suspension of the writ of *habeas corpus*, unless when in cases of rebellion or invasion the public safety may require it; the passing of any bill of attainder or *ex post facto* law; the imposition of any capitation or other direct tax except in proportion to the census, or of any tax or duty on articles exported from any state; and the passing of any commercial or revenue regulation giving a preference to the ports of one state over those of another state, or obliging vessels bound to or from one state to enter, clear, or pay duties in another. No money can be drawn from the treasury except in consequence of appropriations made by law, and a statement of the public receipts and expenditures must be published from time to time. No title of nobility can be granted by the United States, and no person holding any office of profit or trust under them can without the consent of congress accept of any present, emolument, office, or title of any kind from any king, prince, or foreign state. The right of the people to bear arms may not be infringed; soldiers may not be quartered in any house in time of peace without the consent of the owner, nor even in time of war except in a manner to be prescribed by law. The persons, houses, papers, and effects of the people are exempt from search and seizure except under a warrant issued upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched and the persons or things to be seized. No person may be held to answer for a capital or otherwise infamous crime unless on a presentment or indictment of a grand jury, except in cases arising in the land or naval forces, or in the militia when in actual service in time of war or public danger; nor may any person be subject for the same offence to be twice put in jeopardy of life or limb; nor be compelled in any criminal case to be a witness against himself; nor be deprived of life, liberty, or property, without due process of law. In all criminal prosecutions, the accused shall enjoy the right to a speedy and public trial by an impartial jury of the state and district wherein the crime shall have been committed; to be informed of the nature and cause of the accu-

sation; to be confronted with the witness against him; to have compulsory process for obtaining witnesses in his favor; and to have the assistance of counsel for his defence. Excessive bail may not be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted. Private property may not be taken for public use without just compensation. No state can enter into any treaty, alliance, or confederation; grant letters of marque and reprisal; coin money, emit bills of credit, or make anything but gold and silver a legal tender for debts; pass any bill of attainder, *ex post facto* law, or law impairing the obligation of contracts; grant any title of nobility; or lay any imposts or duties on imports and exports, without the consent of congress, except what may be necessary for executing its inspection laws. The net produce of all imposts and duties laid by any state on imports or exports shall be for the benefit of the treasury of the United States. Without the consent of congress no state may lay any duty on tonnage; keep troops or ships of war in times of peace; enter into any agreement or compact with another state or with a foreign power; or engage in war unless actually invaded, or in such imminent danger as will not admit of delay. Treason against the United States consists only in levying war against them, or in adhering to their enemies, giving them aid and comfort. The punishment of treason is left to be defined by congress, but no attainder of treason shall work corruption of blood or forfeiture except during the life of the person attainted. Full faith and credit shall be given in each state to the public acts, records, and judicial proceedings of every other state, and citizens of each state are entitled to all the privileges and immunities of citizens in the several states. Fugitives from justice escaping from one state into another shall be delivered up on demand of the executive authority of the state from which they have fled. Persons held to service or labor under the laws of any state, escaping into another state, must be given up on claim of the party to whom their service or labor is due. New states may be admitted into the Union by congress, but no new state can be erected within the jurisdiction of any other state, nor any state be formed by the junction of two or more states or parts of states, without the consent of the legislatures of the states concerned as well as of congress. The several states have exclusive power to prescribe the qualifications of voters and state officers, and the form of their state government. The constitution only requires that the form of government be republican, and that no law or ordinance be passed which would conflict with any law of the United States. Congress has power to dispose of and make all needful rules and regulations respecting the territories or other property belonging to the United States; governors and other functionaries for the organized territories are appointed

by the president. The question as to the right to hold slaves within the territories, which had long been a subject of contention, was settled by the act of congress approved June 20, 1862, prohibiting for ever involuntary servitude except for crime in all the territories of the United States. —The finances of the United States at the close of the war of the revolution were in a most deplorable state; the continental currency authorized by congress, and emitted in vast sums and without any adequate provision for its payment, had depreciated till it was completely worthless; \$500 in continental bills would hardly purchase a breakfast. Spurious emissions of large sums had rendered the whole issue of doubtful character, and much of it was never redeemed. The national debt was very heavy, while the developed resources of the country were small. In 1791 the national debt was \$75,463,476, and for the next 15 years it averaged about \$80,000,000. In 1806 commenced a systematic effort for its reduction, and in 1812 it was \$45,209,738. The war of 1812-'15 raised it to \$127,834,984. The prosperous and peaceful period which followed was eminently favorable to the gradual reduction of the debt, and in 1835 it had been practically extinguished, only \$351,289 remaining, and in 1836 \$291,089. The revenue at this time from the sale of public lands, and the large amount of receipts for customs, had accumulated to such an extent that more than \$28,000,000 was distributed among the states in the ratio of their population, as a deposit liable to be called for by the government in any emergency, but without interest. It has never been recalled. The disasters resulting from the financial crisis of 1837 compelled the government to incur a small debt, which in 1839 was reported at \$11,983,738. This was reduced in the two following years; but while the change in the tariff in 1842* eventually increased the amount of receipts from customs, the heavy expenses incurred in the Florida war more than kept pace with the increasing revenue, and the debt accumulated to \$27,208,451 in 1843. It had fallen to \$16,750,926 in 1846, when the Mexican war and the assumption of the debt of Texas, the Gadsden purchase, and the supposed necessity for maintaining lines of government mail steamers, cooperated to increase the national debt. In 1849 it was \$64,704,694; in 1853, \$67,340,629. From this point it fell off, the surplus revenue at the disposal of the government enabling it to buy up its own bonds, which it often did at a large premium in advance of their maturity. In 1857 the debt stood at \$29,060,887; but by July 1, 1860, it had risen to \$64,769,703. The condition of the country in the last 4 months of Mr. Buchanan's administration compelled a still further increase

of the debt; and at the inauguration of Mr. Lincoln it stood at \$88,995,810. The outbreak of civil war, and the necessity of creating and equipping a new army and navy, required a vast expenditure, which could only be met by the issue of treasury notes and bonds; but the confidence of the capitalists and the people in the stability and financial resources of the government insured the negotiation of these on favorable terms. On Dec. 1, 1861, the new government had issued \$150,000,000 of bonds, \$100,000,000 of which were to run 8 years, and to bear 7.3 per cent. interest, and \$50,000,000 were 20-year bonds at 6 per cent. It had also issued \$24,550,825 of demand treasury notes without interest, and a temporary loan of \$3,998,900 for 60 days; making in all \$178,544,225, and increasing the national debt to \$267,540,035. In 1862 congress authorized the emission of other bonds and demand notes; and on May 29, 1862, the debt actually incurred and remaining unpaid was as follows:

Under what act.	Amount.	Total.
Loans, 1842, 6 per cent.	\$3,883,364 11	
Loans, 1847, 6 per cent.	9,415,350 00	
Loans, 1848, 6 per cent.	8,909,841 80	
Loans, 1853, 5 per cent.	20,000,000 00	
Loans, 1860, 5 per cent.	7,022,000 00	
Loans, 1861, 6 per cent.	18,415,000 00	
Texas indemnity, 5 per cent.	8,461,000 00—	\$70,104,955 91
Treasury notes issued		
Prior to 1857, int. stopped..	105,111 64	
Under act Dec. 13, 1857....	175,900 00	
Under act Dec. 14, 1860....	231,650 00	
June 22, 1860, and February and March, 1861, 6 per ct.	2,767,300 00	
March 2, July 17, and August 5, 1861, 6 per cent.	111,600 00—	3,282,161 64
3-year bonds, 7.3 per cent.	130,523,450 00	
30-year bonds, 6 per cent.	50,000,000 00—	170,523,455 00
Oregon war debt, 6 per cent.	878,450 00	
United States notes, no int.	145,380,000 00	
Certificates of indebtedness, 6 per cent.	47,199,000 00	
5 and 30-year bonds, 6 per ct.	2,699,000 00—	49,818,400 00
4 per cent. temporary loan ...	5,913,042 31	
5 per cent. temporary loan ...	44,965,524 85—	50,778,566 86

Total amount of public debt..... \$491,448,984 11
Average rate of interest on the entire debt, 4.254 per cent.
In tables XXXV. and XXXVI. will be found the annual revenue and expenditures from March 4, 1789, to June 30, 1861, and the condition of the public debt and the payments made for its redemption and interest during the same period. The amount received from loans and treasury notes from March 4, 1789, to June 30, 1861, was \$462,935,664.64. The total of customs, lands, and miscellaneous is larger than the total receipts by about \$89,000,000, a sum which represents losses, unavailable funds, &c. During this period of 72 years there have been 17 general and 18 special tariffs enacted. The dates of the general tariffs are: July 4, 1789; Aug. 10, 1790; March 3, 1791; May 2, 1792; June 7, 1794; Jan. 29, 1795; March 3, 1797; April 27, 1816; May 22, 1824; May 19, 1828; July 14, 1832; March 2, 1833 (the compromise tariff); Sept. 11, 1841; Aug. 30, 1842; July 30, 1846; March 3, 1857; March 2, 1861. The price of the public lands was fixed in 1785 at \$1 per acre; May 18, 1796, it was raised to \$2 per acre, but at a later date was reduced to \$1.25, except in the alternate sections where grants

* The tariffs of 1824, 1828, and 1832 were protective, and that of 1833, known as the compromise tariff, was constructed with a sliding scale which did not reach its minimum of duties till 1841; and the new protective tariff of 1842 had at first the effect of reducing the amount of revenue.

have been made, in which it is held at \$2.50 per acre. The receipts of the government for the year ending June 30, 1861, were:

Balance in the treasury, June 30, 1860	\$3,622,206 71
From customs	32,552,125 64
From public lands	870,658 64
From miscellaneous sources	892,199 64
From loans and treasury notes	41,861,709 74

Aggregate receipts from all sources, and balance..... \$46,828,900 27

The expenditures for the same period were:

For the civil list (other than the public debt and the interior department)	\$23,187,208 19
For the interior department (Indians and pensions)	8,760,022 72
For the war department	22,991,150 44
For the navy department	12,428,577 00
For payment of Texas creditors	78,907 27
For redemption of loan of 1846	1,000 00
For the redemption of treasury notes	18,141,900 00
For interest on the public debt	4,000,178 78

Aggregate expenditure..... \$64,578,884 47

Balance in the treasury..... \$2,257,065 80

These statements, it will be noticed, do not include the postal revenue and expenditure, which are distinct, and will be given further on. The secretary of the treasury, at the commencement of the session of the 37th congress (Dec. 1861), presented the following estimates of the receipts and expenditures of the years ending June 30, 1862, and June 30, 1863. Though modified to some extent by circumstances not then foreseen, they will not probably vary greatly from the actual receipts and expenditures. The estimated receipts for the year ending June 30, 1862, were:

Balance in the treasury, July 1, 1861	\$2,257,065 80
From customs	32,193,602 55
From public lands	485,967 08
From miscellaneous sources	1,913,085 98
From loans and treasury notes already realized at that time	197,942,568 14
From amounts yet to be realized on loans of July 17 and August 5	75,442,675 00
From direct tax	20,000,000 00

Aggregate of actual and estimated resources at that time provided, for the year..... \$329,501,994 28

The estimated expenditures were:

For the civil list	\$35,854,626 97
For the interior department (Indians and pensions)	5,996,142 26
For the war department	366,720,544 24
For the navy department	67,817,933 53
For the redemption of the principal of the public debt	45,498,050 00
For Texan debt	112,092 59
For interest on public debt	21,407,062 42

Total estimated liabilities of the year..... \$548,406,422 06

Showing a deficiency of receipts of..... \$218,904,427 68

This deficiency congress provided for by authorizing the issue of legal tender treasury notes and bonds to the necessary amount. For the year ending June 30, 1863, the estimated receipts are:

From customs	\$40,000,000 00
From public lands	800,000 00
From miscellaneous sources	5,000,000 00
From the direct tax laid in 1861	20,000,000 00
From internal duties	20,000,000 00
From the income tax	10,000,000 00

Total..... \$95,800,000 00

The receipts from customs and from taxes are greatly underestimated, as the revival of trade,

the increased duties levied on articles of general consumption, and the proceeds of the comprehensive tax bill passed in June, 1862, could not be predicted. The estimated expenditures for the same year are:

For civil list, other than for the interior department and the public debt	\$23,088,571 2
For interior department (pensions and Indians)	4,192,968 19
For the war department	366,159,946 2
For the navy department	43,164,894 2
Redemption of the loan of 1842	253,904 2
Interest on public debt	29,233,966 2

Aggregate of expenditures for the year..... \$473,881,244 2

Showing a deficiency to be provided for of \$378,081,244 2

The construction of a larger number of iron-plated vessels for the navy than was at that time contemplated, and the increase of the army beyond the numbers specified in the act of July, 1861, have probably raised the amount required for the war and navy departments beyond the sums specified in this estimate. The expenditure under the civil list, in the statement of expenses in 1861, included the compensation of members of congress and the executive and judiciary departments, the officers of the mint and branches, assistant treasurers and their clerks, inspectors, surveyors-general and their clerks, &c., and the expense of the government of the territories. These items amounted to \$6,156,199.25. Under the head of "miscellaneous" are included expenditures for the coast survey; for transportation of the mails to foreign countries and by sea; for deficiencies of revenue in the post office department; collecting the revenue from customs; the erecting and maintenance of lighthouses, &c.; the erection and repairs of marine hospitals, custom houses, &c.; the taking of the 8th census; the printing and binding for the government; and expenses connected with the government of the District of Columbia. The expenditures of the post office department for the fiscal year ending June 30, 1861, were \$13,606,769.11, of which \$8,406,652.51 was for the transportation of inland mails and the payment of route and local agents and mail messengers \$440,524.02 for the transportation of foreign mails, and \$326,097.35 for the ocean mails to California and Oregon; compensation to postmasters and their clerks, \$3,461,863.45; postage stamps and stamped envelopes, \$92,772.70; payments for balances due on British mails \$120,507.82; for balances on French mails \$24,440.59; payments to letter carriers, \$149,073.62, &c. The gross revenue of the year was \$8,849,296.40, of which \$645,498.14 was for letter postage, \$3,864,791.43 for stamps sold, \$571,209.28 for newspaper and pamphlet postage, \$19,805.66 for registered letters, \$149,073.62 on account of letter carriers, \$94,563.45 on account of emoluments, and \$2,854.89 miscellaneous. As compensation for the transportation of free mail matter, \$700,000 was appropriated from other funds, and the deficiency in the receipts beyond this was \$4,551,966.95. The whole number of post offices, June 30,

1861, was 28,586; the number of route agents was 392, and of local agents 35; the number of mail routes was 6,340, and their length 140,399 miles, of which 22,018 miles was by railroad, 5,339 by steamboat, 30,738 by coach, and 82,309 by inferior means of transportation. The number of miles of annual transportation was 54,455,454. The cost of railroad transportation averaged 11 cts. per mile; steamboat, 15½; coach, 11; and inferior modes, 7 cts. The U. S. mint is considered a bureau of the treasury department. In the following table its coinage is given from 1858, the date to which it is brought down in the article COIN:

Years.	Gold.	Silver.	Aggregate.
1859.....	\$19,777,418 70	\$4,699,223 95	\$24,476,642 65
1860.....	23,447,283 85	3,250,686 26	26,697,919 61
1861.....	80,708,400 64	3,383,706 94	83,592,107 58
Total.....	\$123,983,103 99	\$10,383,567 15	\$134,766,669 84

The following summary gives the amount of coinage of each metal from the establishment of the mint to June 30, 1861:

Gold.....	\$669,116,406 69
Silver.....	128,159,481 97
Copper.....	2,647,478 55
Total.....	\$799,923,862 14

Of this amount about \$520,000,000 was from bullion derived from the mines of the United States. During the year ending June 30, 1861, the mint at Philadelphia, its branch at San Francisco, and the assay office at New York, were more fully employed than in any former year. The amount of bullion received at the mint and its branches and the assay office was: gold, \$116,970,002.66; silver, \$4,624,961.57; total deposits, \$121,594,964.23. Deducting the redeposits, the amount left for coinage was \$72,146,571.01. The coinage for the year was: gold coins, \$60,693,237; fine gold bars, \$20,015,163.64; silver coins, \$2,605,700; silver bars, \$278,006.94; cent coins, \$101,660; total coinage, \$83,693,767.58; number of pieces of all denominations of coin, 28,724,913. The branch mints at Charlotte, N. C., Dahlonega, Ga., and New Orleans were seized by the confederate authorities in the winter or early spring of 1861, and no returns were made from them later than March, 1861. In table XXVII. will be found detailed statistics of the banks of the different divisions of the United States for the 3 years ending June 30, 1858-'61; and table XXVIII. completes the view of the banking interest in the United States, from the date at which it is left in the article BANK to the close of 1861.—The policy of the country has never been to keep a strong military force in time of peace, but to rely upon volunteers in case of any emergency. In March, 1861, the army consisted of one major-general (lieutenant-general by brevet), 4 brigadier-generals, and 16,000 other officers and men. The several arms of the service were: 1 corps of engineers, 1 corps of topographical engineers, 1 ordnance corps, 2 regiments of dragoons, 2 regiments of cavalry, 1 regiment of mounted riflemen, 4

regiments of artillery, and 10 regiments of infantry. By act of congress, approved July 29, 1861, the president was authorized to add 22,714 men to the regular army, and the nominal strength of the force is now (July 1, 1862) as follows: 4 major-generals, 10 brigadier-generals, corps of engineers, corps of topographical engineers, ordnance department, 6 regiments of cavalry, 5 regiments of artillery, and 19 regiments of infantry. The organization of the regiments is represented in the following table:

Organization.	Cavalry.	1st, 2d, and 3d regiments of artillery, each.	5th regiment of artillery.	Old infantry regiments, each.	New infantry regiments, each.
Colonel.....	1	1	1	1	1
Lieutenant-colonel.....	1	1	1	1	1
Majors.....	8	2	8	2	8
Captains.....	12	12	12	10	24
First lieutenants.....	12	24	24	10	24
Second lieutenants.....	24	12	24	10	24
Enlist'd men, minimum	1,208	718	1,792	548	1,587
" maximum		1,058	1,794	868	2,867
Total, minimum.....		1,770	1,763	552	1,689
" maximum.....	1,268	1,110	1,867	902	2,440

The new regiments are organized according to their maximum strength, that is, in 8 battalions, but it is not known how large a part of their men have thus far been enlisted. The corps of engineers consists of 1 colonel, 4 lieutenant-colonels, 8 majors, 12 captains, 15 first lieutenants, 15 second lieutenants, and 600 enlisted men. The topographical engineers comprise 1 colonel, 3 lieutenant-colonels, 8 majors, 10 captains, 13 first lieutenants, 13 second lieutenants, and 100 enlisted men. The ordnance department includes 1 brigadier-general, 2 colonels, 2 lieutenant-colonels, 4 majors, 12 captains, 12 first lieutenants, 12 second lieutenants, 15 military storekeepers, and 440 enlisted men. Including these 8 corps, and officers of the staff, of the adjutant-general's department, judge advocate's department, inspector-general's department, one signal officer, and officers of the quartermaster's, the subsistence, the medical, and the pay departments, who are not attached to regimental organizations, the total nominal maximum strength of the regular army is 41,247, which the president is empowered to increase to 44,898 by virtue of the act of June 17, 1860, authorizing him to raise to 74 the number of privates in any company serving on the western frontier and at remote and distant stations. This has been done in 69 of the 196 companies of the old army. In Jan. 1862, the following arsenals and armories were under the supervision of the war department: Kennebec, Me.; Springfield and Watertown, Mass.; Champlain (at Vergennes), Vt.; Watervliet (at West Troy) and New York, N. Y.; Alleghany (at Pittsburg) and Frankford (at Bridesburg), Penn.; Pikesville, Md.; Washington, D. C.; Fortress Monroe, Va.; St. Louis, Mo.; Leavenworth, Kansas; Detroit (at Dearbornville), Mich.; and Benicia, Cal. The arsenals at Fayetteville, N. C., Charleston, S. C., Mount Ver-

non, Ala., Baton Rouge, La., and San Antonio, Tex., were seized by the secessionists at the commencement of the civil war; and that at Harper's Ferry, Va., was burned by the U. S. forces to prevent it from falling into their hands. The only national military academy is that at West Point. On April 15, 1861, the president issued a proclamation calling for 75,000 militia to serve for 3 months in putting down the rising in the southern states, and by July 1, 77,875 men had come forward and were in the field. On May 4 a second call was made for 42,000 volunteers to serve 3 years or during the war, and on July 27 congress requested the states to furnish 500,000 volunteers for the same period. On Dec. 1 the strength of the entire army, volunteers and regulars, was reported by the secretary of war as follows:

Arms.	Volunteers.	Regulars.	Aggregate.
Engineers.....	107	107	107
Cavalry.....	54,664	4,744	59,398
Artillery.....	20,380	4,308	24,688
Riflemen and sharpshooters.....	8,395	8,395	8,395
Infantry.....	557,208	11,175	568,383
Total.....	640,637	20,334	660,971

In July, 1862, the president issued a call for 800,000 more volunteers, and on Aug. 4 ordered a draft of 800,000 militia, to serve for 9 months. The number of major-generals of volunteers, July 1, 1862, was 21, and of brigadier-generals 194. The number of general officers of volunteers is limited by act of congress to 40 major-generals and 200 brigadier-generals. The militia force of the United States, according to the latest returns received at the office of the adjutant-general, is 3,214,769, including 500 general officers and 3,453 general staff officers. These figures, however, can only be taken as approximative. Three of the states and all the territories except Utah have made no returns, and the returns from the others are for various dates from 1827 to 1860. (See MILITIA.) A large part of the militia is included in the above mentioned volunteer force, many regiments having entered the service in a body. By act of congress passed July 16, 1862, the president is authorized in certain emergencies to call forth the militia of any or all the states of the Union, and to continue them in service 9 months; and if, in consequence of defects in any of the state laws or in the execution of them, it shall be necessary to provide for enrolling the militia or otherwise putting this act into operation, the president is authorized to make all necessary rules and regulations. The enrolment of the militia must in all cases include all able-bodied male citizens between the ages of 18 and 45, and must be apportioned among the states according to representative population.—The navy, at the outbreak of the civil war in 1861, consisted of 90 vessels, pierced for about 2,415 guns. This included vessels on the stocks, stationary store ships, receiving ships, and vessels worn out and not worth repairing. The available force was:

1 ship of the line.....	84 guns
8 frigates.....	400 "
20 sloops.....	406 "
3 brigs.....	16 "
8 store ships.....	7 "
6 steam frigates.....	212 "
5 first class steam sloops.....	90 "
4 first class side-wheel steamers.....	46 "
8 second class steam sloops.....	45 "
5 third class screw steamers.....	28 "
4 second class side-wheel steamers.....	8 "
2 steam tenders.....	4 "

60 1,346 guns

Of this force the following were in commission, the remainder being in ordinary, dismantled, &c.:

2 frigates.....	100 guns
11 sloops.....	222 "
3 store ships.....	7 "
1 screw frigate.....	72 "
5 first class steam sloops.....	90 "
8 side-wheel steamers.....	35 "
8 second class steam sloops.....	45 "
5 third class screw steamers.....	28 "
3 side-wheel steamers.....	5 "
1 steam tender.....	1 "

43 555 guns

These vessels had a complement, exclusive of officers and marines, of about 7,600 men. One vessel (the sloop *Levant*) was lost in the Pacific; one steamer fell into the hands of the confederates at Pensacola; one steam frigate (the *Merrimac*), partially destroyed and sunk at Norfolk, was afterward raised by the confederates and cased with iron; and two sloops and one brig, beside several worthless vessels, were destroyed at Norfolk when that place was abandoned by the United States forces. By the completion of unfinished vessels, and the construction and purchase of others, the navy had been increased, at the date of the last report of that department (Dec. 1861), to 264 vessels (including those under construction), mounting 2,557 guns, measuring 218,016 tons, and manned by 22,000 seamen. These were as follows:

Class.	No. of vessels.	Guns.	Tonnage.
OLD NAVY.			
Ships of the line.....	6	504	16,094
Frigates.....	7	350	12,104
Sloops.....	17	342	16,031

Steam gunboats.....	23	92	11,661
Side-wheel steamers.....	12	48	8,400
Iron-clad steamers.....	3	38	4,800
Total.....	264	2,557	218,016

The purchased vessels were all selected from

the merchant marine, and altered to fit them to the necessities of war. Though most of them would be found incapable of standing a regular naval contest, they have proved well adapted for blockading service, for transports, and for coast and river fleets. In addition to the vessels enumerated above are the gunboat, ram, and mortar fleets built for action on the Mississippi and other western waters, under authority of the war department, but since transferred to the control of the secretary of the navy. The gunboats, constructed by order of Gen. Fremont, are 12 in number, mounting in the aggregate 126 guns, beside a rifled 12-pounder boat howitzer on each vessel. The guns are all 32, 42, and 64-pounders, except one, a 128-pounder. Seven of the gunboats are iron-plated. Gen. Fremont also caused 38 mortar boats to be built, each about 60 feet long and 25 feet wide, surrounded by iron-plated bulwarks, and carrying one 13-inch mortar. A number of schooners included in the above list of purchased vessels have also been fitted up as mortar boats, and were engaged in the capture of the Mississippi forts below New Orleans. The ram fleet, which first came into action in the naval engagement near Memphis, was fitted out by the late Col. Ellet. It consists of 8 or 10 river steam towboats, strengthened and armed with iron prows for the purpose of running down the vessels of the enemy. A number of iron and iron-clad vessels are now (Aug. 1862) building, including 6 on the plan of the floating battery Monitor. In Feb. 1862, congress authorized the construction of 20 iron-clad gunboats, appropriating \$10,000,000 for that purpose. A naval school for the education of officers was established at Annapolis, Md., in 1845, and temporarily removed in April, 1861, to Newport, R. I. By act of congress approved July 16, 1862, the active list of line officers in the navy, with the maximum number of officers allowed to each grade, is constituted as follows; 9 rear admirals; 18 commodores; 36 captains; 72 commanders; 144 lieutenant-commanders; 144 lieutenants; 144 masters; 144 ensigns; and midshipmen (students of the naval academy) to the number of 2 for every member and delegate of the house of representatives, 2 for the District of Columbia, and 10 appointed at large by the president, beside whom the president may appoint 3 midshipmen yearly, to be selected from boys enlisted in the navy. The navy yards, at the commencement of President Lincoln's administration, were at Portsmouth, N. H.; Charlestown, Mass.; Brooklyn and Sackett's Harbor, N. Y.; Philadelphia, Penn.; Washington, D. C.; Norfolk, Va.; Pensacola, Fla.; and Mare island, Cal. By the act of congress reorganizing the navy department, approved July 5, 1862, the following bureaus are created: yards and docks, equipments and recruiting, navigation, ordnance, construction and repairs, steam engineering, provisions and clothing, and medicine and surgery. The marine corps is organized as a brigade, and sub-

ject to the laws and regulations of the navy except when detached for service with the army by order of the president of the United States. As reorganized by Congress in 1861, it consists of 1 colonel commandant, 1 colonel, 2 lieutenant-colonels, 4 majors, 1 adjutant and inspector, 1 paymaster, 1 quartermaster, 2 assistant quartermasters, 20 captains, 80 first lieutenants, 80 second lieutenants, and 8,074 enlisted men.—**HISTORY.** The country now comprised within the United States was, when first visited by Europeans, exclusively inhabited by the red or copper-colored race commonly called American Indians. Of the origin of these people nothing is positively known, though their own vague traditions and their general resemblance to the tribes of north-eastern Asia give a certain degree of plausibility to the theory that their ancestors came to America by way of Behring's straits or the Aleutian islands. There is some reason to believe that these savages were not the first occupants of the land, in almost every part of which, and especially in the valley of the Mississippi, are found monuments consisting of mounds and other earthworks of great extent, which are supposed to have been erected by an unknown and long extinct race. In physical appearance, manners, customs, religion, and social and political institutions, the Indians were so strikingly alike as to form but one people; yet they were divided into a multitude of tribes almost perpetually at war with each other, and speaking a great variety of dialects, among which have been traced 8 radically distinct languages, viz., the Algonquin, Iroquois, Cherokee, Catawba, Uchee, Natchez, Mobilian, and Dacotah or Sioux. The Algonquins inhabited the territory now included in New England, a part of New York and Pennsylvania, New Jersey, Delaware, Maryland, Virginia, North Carolina as far south as Cape Fear, a large part of Kentucky and Tennessee, and the greater portion of Ohio, Indiana, Illinois, Michigan, Wisconsin, and Minnesota. Their most important tribes were the Knisteneaux, Ottawas, Chippewas, Sacs and Foxes, Menomonees, Miamies, Piankeshaws, Potawatomes, Kickapoos, Illinois, Shawnees, Powhatans, Corees, Nanticokes, Lenni-Lenapes or Delawares, Mohegans, Narragansets, Pequots, and Abenakis. The Iroquois occupied nearly the whole of that part of Canada which lies south of the Ottawa, between Lakes Ontario, Erie, and Huron, the greater portion of New York, and that part of Pennsylvania and Ohio which lies along the southern shore of Lake Erie. They were completely surrounded by the territories of their enemies the Algonquins. Their chief tribes, the Senecas, Cayugas, Onondagas, Oneidas, and Mohawks, formed a confederacy which was known to the English as the Five Nations, and after 1722, when they admitted the Tuscaroras, as the Six Nations. The English, however, often termed them collectively the Mohawks or Mingoes, the latter name being given them by the Algonquins.

The name Iroquois was applied to them by the French. Their own national appellation was Konoskioni or "cabin-builders." The Catawbas dwelt upon the Yadkin and Catawba rivers, along the line that now separates North and South Carolina. The land of the Cherokees extended from the Carolina Broad river on the east to the Alabama on the west, including the whole upper part of Georgia. Below them, on the Savannah, the Oconee, and the head waters of the Great Ogeechee and the Chattahoochee, were seated the Uchees, who spoke a harsh and peculiar language, and were apparently the decayed remnant of a once powerful nation. The rest of the state of Georgia, part of South Carolina, Tennessee, and Kentucky, and the whole of Florida, Alabama, and Mississippi, were occupied by a great number of kindred tribes who are known in our history as the Mobilian nation. Their territory, which was only inferior in extent to that of the Algonquins, stretched along the gulf of Mexico from the Atlantic to the Mississippi. They were divided into three great confederacies of tribes, the Muscogees or Creeks, the Choctaws, and the Chickasaws. Among their sub-tribes of most note were the Seminoles and Yemassees, who belonged to the Creek confederacy. A small territory on the eastern side of the Mississippi, on the banks of the Pearl river, was occupied by the Natchez, who, though surrounded by Mobilian tribes, were a distinct people, speaking a language of their own, and worshipping the sun. Beyond the Mississippi were the numerous tribes of the Dacotahs or Sioux, who occupied the country between the Arkansas on the south and Lake Winnipeg on the north, and westward to the Rocky mountains. Their principal divisions were the Winnebagoes, who dwelt between Lake Michigan and the Mississippi; the Assiniboinis, the most northerly in position; the Minatarees, Mandans, and Crows, who lived west of the Assiniboinis; and the southern Sioux, who held the country between the Arkansas and Platte rivers. Beyond the Dacotah nation, on the great plains, in the Rocky mountains, and on the Pacific slope, were the powerful tribes of the Pawnees, Comanches, Apaches, Utahs, Blackfeet, Snakes, Nezperces, Flatheads, and California Indians. While in possession of its savage aborigines, the country from the Mississippi to the Atlantic, and from the lakes to the gulf of Mexico, with comparatively slight exceptions, was one vast forest, inhabited by wild beasts, whose pursuit formed the principal occupation of the Indians, and gave them their chief means of subsistence and clothing.—According to the Scandinavian sagas, Leif, a Norwegian, sailed in 1002 from Iceland for Greenland, but was driven southward by storms till he reached a country called Vinland, from the wild grapes he found growing there. Other Scandinavian adventurers followed him, and made settlements, none of which were permanent. By many writers Vinland is supposed to have been Rhode

Island or some other part of the coast of England, but of its real position nothing is certainly known; and if these northern legends be rejected as too vague to afford a basis for sober history, we must conclude that the territory now comprised within the United States was first visited by Europeans about 5 years after Columbus discovered the West Indies. In 1497 John Cabot, a Venetian, commanding an English ship under a commission from Henry VII., sailed from Bristol westward, and on June 24 discovered land, along which he coasted to the southward for the distance of nearly 1,000 miles, landing at various points and planting on the soil the banners of England and of Venice. In the following year his son Sebastian Cabot sailed with two ships from Bristol in search of a north-west passage to China; but finding the ice impenetrable, he turned to the south and coasted along as far as the entrance of Chesapeake bay. A few years later, in 1513, the Spaniard Ponce de Leon discovered Florida, and took formal possession of the country near where St. Augustine now stands; but on attempting shortly afterward to plant a colony, he was repulsed and mortally wounded by the natives. Toward the close of 1523 Francis I. of France sent John Verrazzani, a Florentine, to explore the North American coast. After a terribly tempestuous passage of 50 days, he made land near Wilmington, N. C. but found no convenient harbor, though he searched for one for 150 miles southward. Returning north, he sailed as far as Nova Scotia, stopping for a while in the harbors of New York and Newport, both of which are described in his narrative. Next followed the famous expedition of the Spaniard De Soto, who in 1539 landed with several hundred followers in Tampa bay on the west coast of Florida, and fought his way in the course of two years through the region which now forms the states of Georgia, Alabama, Mississippi, and Louisiana, to the river Mississippi, beyond which he penetrated for about 200 miles, and to which he returned to die in the third year of his expedition. After his death his discouraged followers descended the river in boats, and crossed the gulf to the Spanish settlements in Mexico. For a long period no further attempt was made by the Spaniards to colonize Florida. But in 1564 the French Calvinists, under the direction of Admiral Coligni, endeavored to found there a colony which might become a place of refuge for the persecuted Huguenots. Charles IX. conceded an ample charter, and an expedition under Jean Ribault made a settlement at Port Royal in South Carolina, the name of Carolina being then first given to the country in honor of King Charles. This colony was soon abandoned, and another, composed also of Protestants, was planted on the banks of the St. John's in Florida, which in 1565 was surprised and massacred by the Spaniards, who in the same year founded St. Augustine, now the oldest of American cities, and the first permanent settle-

ment in the United States.—The discoveries of the Cabots had given the English crown a claim to North America, which, though not prosecuted for nearly a century, was never relinquished, and which led in the reign of Elizabeth to efforts at colonization on a large scale. In 1585 an expedition sent by Sir Walter Raleigh made a settlement on Roanoke island in North Carolina, which however failed so utterly that in a few years not a trace of it remained, the last of the colonists having been carried off captives by the Indians. James I. in 1606 divided the American territory claimed by England into two parts: South Virginia, extending from Cape Fear to the Potomac, and North Virginia, from the mouth of the Hudson to Newfoundland. Two companies were formed in England for the colonization of America: the London company, to which was granted South Virginia, and the Plymouth company, to which was granted North Virginia; and it was agreed that the region between the Potomac and the Hudson should be neutral ground on which either company might make settlements. The London company was earnest in the undertaking, and in 1607 sent out 8 ships and 105 emigrants, who entered Chesapeake bay, and founded on May 18 the commonwealth of Virginia by building Jamestown on James river, both names being given in honor of the English king. Capt. Newport commanded the expedition, but the master spirit of the enterprise was the celebrated Capt. John Smith, whose prudence, energy, and courage carried the settlement successfully through the perils which beset it, on the one hand, from the bad character of many of the colonists (who were, as Smith says, "unruly sparks packed off by their friends to escape worse destinies at home," and "poor gentlemen, broken tradesmen, footmen, and such as were much fitter to spoil and ruin a commonwealth than to help to raise or maintain one"), and on the other hand from the hostility of the natives, who however in 1614 were conciliated and made friendly for some years by the marriage of Pocahontas, the daughter of their king or principal chief Powhatan, to an Englishman. The government of Virginia was at first retained by the king in the hands of councils subject to his appointment or control; but after repeated changes the constitution was at length so framed that a house of burgesses chosen by the people was instituted, which met for the first time June 19, 1619. This was the beginning of representative government in America. It was closely followed by two events, both seemingly of slight importance at the time, but both destined to have a powerful and long continued influence on American affairs. In Aug. 1619, a Dutch man-of-war entered James river, and sold 20 Africans to the planters, thus introducing slavery into the colony; and two years afterward, in 1621, the cultivation of cotton was commenced. Capt. John Smith had returned to England in 1609, and in 1614 sailed

again for America; and having examined the coast from the Penobscot to Cape Cod, he named the country New England. Previous to this, in 1607, two ships, commanded by Raleigh and Gilbert, had carried out a company of 45 emigrants, led by George Popham, by whom a settlement named St. George was formed near the mouth of the Kennebec, and abandoned in the following year. Smith on his return home published a map and description of New England, which, together with his personal representations of the advantages of emigration, excited much enthusiasm in England for colonizing America; and a patent was obtained from the king for a new company incorporated as "the council established at Plymouth in the county of Devon for the planting, ruling, ordering, and governing New England in America," which gave the planters absolute property, with unlimited jurisdiction, the sole powers of legislation, the appointment of all officers and all forms of government, over the territory, extending in breadth from the 40th to the 48th degree of north latitude, and in length from the Atlantic to the Pacific. This area comprised more than a million of square miles, and covered the present provinces of Nova Scotia, New Brunswick, and the Canadas, New England, New York, Pennsylvania, nearly half of New Jersey, and all the continent lying directly west of those states. The first English settlement within its limits, however, was established without the knowledge of the corporation and without the aid of King James, by the "pilgrim fathers of New England," a body of Puritans who, led by John Carver, William Brewster, William Bradford, Edward Winslow, and Miles Standish, sailed from England, Sept. 6, 1620, in the *Mayflower*, a vessel of 180 tons burden, and landed Dec. 21 (Dec. 11, O. S.), to the number of about 100 men, women, and children, at a harbor in Massachusetts bay where they began to build a town, which they called Plymouth in memory of the hospitalities received at the last English port from which they had sailed. "A grateful posterity," says Bancroft, "has marked the rock which first received their footsteps. The consequences of that day are constantly unfolding themselves as time advances. It was the origin of New England; it was the planting of the New England institutions. Inquisitive historians have loved to mark every vestige of the pilgrims; poets of the purest minds have commemorated their virtues; the noblest genius has been called into exercise to display their merits worthily, and to trace the consequences of their daring enterprise. . . . As the pilgrims landed, their institutions were already perfected. Democratic liberty and independent Christian worship at once existed in America." The government of the colony was strictly republican. The governor was elected by the people, and restricted by a council of 5 and afterward of 7 assistants. The legislature at first comprised the whole body of the peo-

ple, but as population advanced the representative system was adopted. The foundation of the Plymouth colony was followed by that of Massachusetts Bay, where Salem was settled by John Endicott in 1628. In 1630 a fleet arrived with 840 additional emigrants, with John Winthrop, a man approved for piety, liberality, and conduct, at their head as governor, and Thomas Dudley as deputy governor. In September of the same year they settled Boston, which they named in honor of the town in England from which came their minister, the Rev. John Cotton. In 1692 Plymouth colony was united to Massachusetts. While these settlements on Massachusetts bay were in progress, Sir Ferdinando Gorges and John Mason obtained a patent for a territory called Laconia, extending from the Atlantic to the St. Lawrence and from the Merrimack to the Kennebec, and settled Portsmouth and Dover in New Hampshire in 1623. In Maine a French colony had been planted in the island of Mount Desert as early as 1613, which was soon broken up by an expedition from Virginia; and the first permanent English settlements in Maine were made at Saco and on the island of Monhegan in 1622 or 1623. These settlements, however, ultimately fell under the jurisdiction of Massachusetts, and Maine continued to form a part of that commonwealth till 1820. Connecticut was colonized in 1635 by emigrants from Massachusetts, who settled at Hartford, Windsor, and Wethersfield, though a few huts had been erected at the latter place a year or two before, and the Dutch, who claimed the territory, had in 1633 built a fort and trading house at Hartford. Rhode Island was first settled at Providence in 1636 by Roger Williams, who had been exiled from Massachusetts for maintaining religious and political opinions at variance with those of the rulers of that colony. The first white man that ever set foot upon the soil of New York was Samuel Champlain, the French navigator, who in July, 1609, entered the lake which bears his name, and fought a battle on its shores with a band of Mohawks, whom he defeated, and thus brought upon the French the lasting hatred of the powerful confederacy of the Six Nations. Later in the same year, Sept. 6, Henry Hudson, an Englishman in the service of the Dutch East India company, entered New York bay and discovered the river to which his name has been given, and which he ascended nearly as far as the site of Albany. The region thus discovered was claimed by Holland and named New Netherlands; and in a few years trading posts were erected at Fort Orange, now Albany, and on Manhattan island. In 1623, 18 families settled at Fort Orange, and 80 families at New Amsterdam on Manhattan island, on the present site of the city of New York. The Dutch settlements gradually spread up the river, and eastward to the Connecticut, and westward and southward to the Delaware. On the latter river they came in collision with the Swedes, who had settled there in 1638 and

occupied both banks in Delaware and Pennsylvania nearly to the site of Philadelphia and named their settlements New Sweden. They were finally expelled in 1655 by a Dutch army; but the English, who claimed the whole country under the right given by Cabot's discovery, after much diplomatic controversy protruded through nearly half a century, at length ended the contest by seizing New Amsterdam by force in 1664, and with it the whole of New Netherlands. The province in the same year had been granted by Charles II. to his brother the duke of York and Albany, in whose honor New Amsterdam was named New York, which also became the name of the province, while Fort Orange became Albany. New Jersey at this time acquired its distinctive name from Sir George Carteret, who had been governor of the island of Jersey, and in conjunction with Lord Berkeley had purchased the territory from the duke of York and made it a separate colony. In 1681 the territory west of the Delaware was granted to William Penn, who colonized it chiefly with Friends or Quakers, and founded Philadelphia in 1682. Pennsylvania soon became one of the most flourishing of the colonies, and was honorably distinguished among them for the kindness and justice of its treatment of the Indians, and its consequent exemption for nearly a century from the horrors of savage warfare. About 1710 a large immigration of Germans began, which peopled several counties and gave a peculiar character to the population of the province. The country between the southern line of Pennsylvania and the Potomac was early called Maryland, in honor of Henrietta Maria, the queen of Charles I. The first settlement within its limits was made in 1631 by Capt. William Clayborne, with a party of men from Virginia, on Kent island in Chesapeake bay. In 1633 Charles I. granted the province by a charter to Cecil Calvert, Lord Baltimore, who sent out in 1633 a colony of 201 persons, nearly all of them Roman Catholic gentlemen and their servants, led by the brother of the lord proprietor, Leonard Calvert, who became the first governor of the province. They crossed the Atlantic in two vessels named the Ark and the Dove, and landed on St. Clement's island, March 25, 1634. Two days afterward they began a settlement at St. Mary's on the mainland. The first legislature met in 1639, and in 1649 the assembly passed the memorable act by which Christians of all sects were secured in the public profession of their faith, and allowed to worship God according to the dictates of their own consciences. The country south of Virginia was first permanently settled in 1670 by English colonists, who landed at Port Royal, but soon removed to the present site of Charleston. Under the name of Carolina the colony was nominally governed in accordance with the provisions of an aristocratic constitution framed by the philosopher John Locke, till 1727, when the king bought out the proprietors and divided the colony into

two, called respectively North and South Carolina. The present state of Georgia originally formed part of Carolina, but in 1782 George II., in honor of whom it was named, granted the territory to a corporation entitled "the trustees for settling the colony of Georgia;" and in the same year a colony of 120 persons sailed for the new province, under the direction of the celebrated Gen. James Oglethorpe.—In the course of little more than a century from the settlement of Jamestown, 13 colonies were thus founded by the English within the present limits of the United States. Within the same limits the Spaniards had also settled in Florida and New Mexico, and the French had established posts in Illinois, in Indiana, and in Louisiana near the mouth of the Mississippi. Though the emigration to the English colonies was mostly from England itself, and the language, laws, and manners of England everywhere prevailed, Scotland, Ireland, Germany, Holland, France, and Scandinavia each contributed more or less extensively to their population. Nearly all the sects of Christendom were also represented; and while Calvinism predominated in New England, Quakerism in Pennsylvania, and Roman Catholicism in Maryland, the church of England preponderated in New York and in the South. In the genial climate and fertile soil of the southern colonies, where labor was chiefly performed by African slaves, a more easy and lavish style of living prevailed than in the bleak and barren land of the Puritans, though as population advanced the thrift and industry of the Yankees (an Indian corruption of the word English), as the New Englanders were termed by their southern neighbors, produced the usual effects in developing among them a high degree of wealth, comfort, and refinement. Though agriculture was the chief pursuit of the colonists, manufactures and commerce were not wholly neglected. But as early as 1660 the mother country, jealous of the increasing prosperity of her children beyond the Atlantic, began to hamper their trade with navigation acts selfishly designed to compel the commerce of the Americans to pass exclusively through English hands. The house of commons in 1719 declared "that erecting any manufactories in the colonies tended to lessen their dependence upon Great Britain," and laws were accordingly enacted prohibiting the working of iron and steel in the colonies, and restricting other branches of manufacture. It was declared that no sugar, tobacco, ginger, indigo, cotton, fustic, or dyeing woods should be transported to any other country than those belonging to the crown of England, under penalty of forfeiture. The importation of European commodities into the colonies was prohibited except in English ships from England, and thus the colonies were compelled to buy in England not only all English manufactures, but every thing else that they might need from any soil but their own. The colonists were allowed to sell to foreigners

only what England would not take, that so they might gain means to pay for the articles forced upon them by England. As they could buy few European and no Asiatic commodities except in the mother country, the English merchant was able to sell his goods for more than they were worth, and at the same time, being the sole legal purchaser of colonial products, could obtain these products at less than their fair value. In spite of these obstacles, the enterprise and industry of the colonists soon created a vigorous commerce, and even manufactures were not unknown, especially in Massachusetts, where the people manufactured paper, woollen goods, hemp, and iron, and nearly every family made coarse cloth for its own use. Notwithstanding their general poverty, and the hardships incident to the condition of a scanty population busily engaged in subduing the wilderness and its tribes of savages, the colonists, especially in New England, paid prompt and special attention to education. Schools were formed in Virginia as early as 1621, and in 1699 William and Mary college was established at Williamsburg. A school was founded in New Amsterdam in 1638. Harvard college in Massachusetts was founded in 1637, and Yale college in Connecticut in 1701; the college of New Jersey was incorporated in 1788, and King's (now Columbia) college in New York in 1754. In the New England colonies, as soon almost as they were founded, laws were enacted providing for a liberal system of common schools, under which the people soon became remarkable for intelligence; a system continued with unbroken perseverance and with ever increasing improvement to the present day.—The 13 colonies thus settled in the course of little more than a century from the foundation of Jamestown were New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina, and Georgia. The details of colonial history being given in this work under the names of the individual states, we shall only notice here the most prominent events of general interest, which may be classed under the three heads of Indian wars, French wars, and political struggles against the English government. The Indians at first received the whites as friends; but the steady encroachments of the settlers on their hunting grounds, and the manifold causes of quarrel incident to the contact of races so different, speedily led to acts of violence on both sides, and at length to open war, though to the last a few tribes continued faithful friends to the Europeans. In the infancy of the settlements these conflicts with the warlike savages were often bloody and perilous; but as the colonies grew in strength, their numbers, discipline, and superiority in arms gave them an assured victory whenever roused to put forth their power. The first serious encounter took place in 1622, after the death of the friendly Powhatan, when

a general conspiracy of the Indians of Virginia broke out in a bloody massacre, in which in one hour 350 of the English fell beneath the tomahawk. The colonists were victorious in this contest, and again in 1644-'6, when the Virginian tribes made their last struggle for independence, led by Opechancanough, who was captured and kept in prison till he died. From that period the red men gave little further trouble in Virginia, but peacefully submitted to the colonial authorities. In 1636 the powerful Pequot tribe commenced hostilities in Connecticut, which soon spread into Massachusetts and provoked an alliance of those colonies, by whose forces in 1637 the hostile nation was utterly destroyed, and such a terror struck into the remaining tribes that they did not venture again to molest the whites till 1675, when the famous Metacomet, sachem of the Wampanoags, or King Philip as he was called by the English, effected a general combination of the aborigines against the colonists. A terribly destructive war ensued, which for some months threatened the extermination of the European population of New England, but was finally ended by the defeat and death of Philip in 1676. Forty years later the Carolinas became involved in a fierce and sanguinary struggle with the Corees and Tuscaroras (1712), and with the Yemassees (1715), in both of which the whites were victorious. Notwithstanding these and other signal successes for more than a century and a half after the first settlement, there were few parts of the country which had not cause from time to time to tremble at the apprehension or the actual outbreak of Indian warfare, with its horrid accompaniments of outrage, massacre, and devastation, in which neither sex nor age was spared by the ruthless enemy. Toward the close of the 17th century the hostile Indians on the northern and western frontiers began to receive powerful aid and encouragement from the French in Canada, who, whenever their mother country was at war with England, carried on hostilities with the English colonies, and frequently, accompanied by their savage allies, made destructive inroads into New England and New York. In one of these incursions in 1689, Dover in New Hampshire was burned by the Abenakis or eastern Indians, and all the inhabitants were killed or carried away captive; and in the following year a similar fate was inflicted on Schenectady in New York, by a party from Montreal. A few years later (1704-'8) Deerfield and Haverhill in Massachusetts were destroyed, with hundreds of men, women, and children, by bands led by Hertel de Rouville, a French officer. Father Marquette, Louis Joliet, Robert Cavalier de la Salle, and other able and enterprising missionaries and adventurers, had carried the cross and the standards of France through the wilderness, from the St. Lawrence and the great lakes to the Mississippi and the gulf, and even into Texas; and gradually the English settlements on the Atlantic were flanked on their

western side by a chain of French posts amounting finally to more than 60 in number between Montreal and New Orleans. May of these positions, selected with judgment in an early period, became afterward important towns, as Detroit (1683), Kaskaskia (1684), Vincennes (1690), New Orleans (1717), and Pittsburg (Fort Duquesne, 1754). This threatening lodgment of the French in the rear of their American colonies greatly excited the jealousy of the English, who, under the charters granted by James I., claimed dominion westward from the Atlantic to the Pacific south of the latitude of the north shore of Lake Erie, while the French claimed all the territory watered by the Mississippi and its tributaries under the more plausible title of having made the first explorations and settlements. The earliest conflict between the two nations in America arose, however, not from any colonial quarrel, but from the revolution of 1688, and is known as King William's war. It lasted 7 years, and during its continuance the colonies suffered exceedingly from the incursions of the French and their Indian allies. In retaliation for these attacks efforts were made by the colonists to conquer Canada, against which in 1690 two expeditions were sent, one from Massachusetts under Sir William Phipps, and another from Connecticut and New York under Gen. Winthrop, neither of which accomplished any thing of importance. The war was terminated by the treaty of Ryswick, Sept. 20, 1697, but peace was not of long continuance. The war of the Spanish succession, which began in 1702, involved in its hostilities the French and English in America, where the contest is known in tradition and history as Queen Anne's war. Its effects were chiefly felt in New England, whose whole western frontier was ravaged by the Indians to such an extent that most of the remote settlements were destroyed or abandoned. In 1707 Massachusetts, New Hampshire, and Rhode Island combined their forces and made an attack on the French in Acadia, but effected nothing. Three years later, in Sept. 1710, an expedition from Boston succeeded in conquering Acadia, and annexing it to the English empire under the title of the province of Nova Scotia. A powerful armament of English and New England troops under Sir Hovenden Walker, attempted in the following year the conquest of Canada by sea, but failed, as did another expedition which at the same time marched from Albany to attack Montreal. The peace of Utrecht (April 11, 1713) terminated hostilities, which were not resumed for more than 30 years. At the expiration of that period the war of the Austrian succession broke out in Europe (March, 1744), and spread to America, where it is known as King George's war. Its principal event was the capture of Louisburg, the chief stronghold of the French in America, which was taken June 28, 1745, by a force from New England led by William Pepperell, a wealthy merchant

of Maine. This exploit excited much enthusiasm in England as well as in the colonies, and gave the Americans an idea of their own military strength which had an important influence on the future. The war ended by the treaty of Aix la Chapelle, Oct. 18, 1748, and much to the disgust of the colonists Louisburg was restored to the French. Peace, however, was not of long continuance. The governor of Virginia, by command of the home government, granted to the "Ohio company," in 1749, 600,000 acres lying between the Monongahela and Kanawha and on the Ohio, in a region claimed by France. The company attempted to form settlements, and speedily became involved in disputes with the French, whose posts preoccupied various points in the country. The Virginia authorities took up the quarrel, and their first step was to send a letter of remonstrance to the French commandant on the Ohio. This message was intrusted to George Washington, a youth of less than 22 years of age, but who had already filled for 8 years the office of adjutant-general of the northern district of Virginia, and acquired a reputation for prudence and ability. He performed his mission with courage and judgment, and his report led Virginia to prepare to assert her rights by force. An expedition, of which Washington, at first second in command, soon became chief, was sent toward the Ohio, and on May 28, 1754, attacked and cut to pieces a French detachment under Jumonville, who was slain in the fight. This affair began the long contest known in America as the French and Indian, and in Europe as the 7 years' war. Hostilities, however, were waged in America for more than a year and a half before war was formally declared between France and England; but while still professing to be at peace, each country actively sent military and naval aid to its belligerent colonies. Four expeditions against the French were planned by the English commanders: one to capture the posts near the head of the bay of Fundy, and to expel the French from Acadia; another against Crown Point, to be led by Sir William Johnson, Indian agent among the Mohawks; the third against Niagara and Frontenac, to be commanded by Gov. Shirley of Massachusetts; and the fourth, against Fort Duquesne on the Ohio, was to be led by Gen. Braddock, who had been sent from England as commander-in-chief of the royal forces. He was an officer of high reputation as a martinet, but arrogant, conceited, and, like most of his countrymen at that period, full of stupid contempt for the Americans. With a mixed force of regulars and provincials, the latter commanded by Washington, he moved through the wilderness with all the formality of a military march in open country, and not sufficiently mindful of the precautions which Washington and other Virginians acquainted with the Indian mode of warfare entreated him to take. The result was, that about 10 miles from Fort Duquesne he fell into an ambush,

and was defeated and mortally wounded. The army was withdrawn from danger chiefly by the steadiness and skill of Washington and his despised provincials, who covered the retreat. It may be noticed as the most permanent result of this expedition, that it shook the confidence of the people in the prowess of the British soldiery, disgusted them with the haughtiness and conceit of the British officers, and gave to Washington a hold on popular esteem and confidence which was never afterward shaken. Shirley's expedition, though less disastrous than that of Braddock, was also a failure. It was impeded by storms and sickness, and by the desertion of its Indian allies, who belonged to the tribes of the Six Nations, and was finally given up without having effected any thing. The attack on the French posts at the bay of Fundy was led by Gen. Winslow, a New Englander, who succeeded in his enterprise, and subsequently, at the express orders of the government, transplanted the "neutral French" from Acadia to the English colonies. The expedition of Sir William Johnson against Crown Point was composed chiefly of troops from Massachusetts, Connecticut, and New Hampshire. It encountered the enemy at the head of Lake George, and in one day, Sept. 6, 1755, suffered a repulse and gained a complete victory, in which the French commander Dieskau was incurably wounded and made prisoner. Johnson did not know how to improve his victory, the honor of which belonged in fact to the provincial general Lyman, and loitered in his camp at Lake George until it was too late to push on to Crown Point; and the campaign of 1755 ended on the whole more favorably for the French than the English. The energy and ability of the marquis de Montcalm, who succeeded Dieskau as commander-in-chief in Canada, gave during the next two years a still more marked superiority to the French arms. Oswego, with an immense amount of military stores, was captured in 1756; and Fort William Henry, at the head of Lake George, was compelled to surrender in 1757, an event long remembered with horror from the massacre of part of the garrison after the capitulation by Montcalm's Indian allies. These disasters in America were rightly attributed by the English people to the imbecility of their rulers and generals, and their clamors compelled the king reluctantly to call William Pitt to the head of affairs. His genius and energy speedily retrieved the fortune of the war. His call for volunteers from the colonies was responded to in numbers greater by thousands than he had asked for, and the campaign of 1758 opened with 50,000 men in the field under the English banner. Louisburg was taken after a siege of 50 days by Generals Amherst and Wolfe; Fort Frontenac on Lake Ontario was captured by Col. Bradstreet, with a provincial force; and Fort Duquesne met the same fate from an expedition of which Washington was one of the commanders. These advantages, however,

were counterbalanced by the repulse of an attack on Ticonderoga made by a powerful army under Gen. Abercrombie and Lord Howe, in which the latter officer, who was greatly beloved, fell at the head of his troops, while the former so mismanaged the enterprise that, although his forces were 4 times as numerous as those of Montcalm, he was obliged to retreat with a loss of 2,000 men. Abercrombie was promptly superseded by Amherst, before whose approach in 1759 the French fled from Ticonderoga and Crown Point without striking a blow. Almost at the same time Niagara was taken by Sir William Johnson, and a large force sent to its relief was completely routed. The crowning exploit of the campaign and of the war was the taking of Quebec by an army led by Gen. Wolfe, after a battle on the plains of Abraham (Sept. 13), in which both Wolfe and Montcalm were killed. This victory, "one of the most momentous in the annals of mankind," says Bancroft, "gave to the English tongue and the institutions of the Germanic race the unexplored and seemingly infinite west and north. . . . America rung with exultation; the towns were bright with illuminations, the hills with bonfires; legislatures, the pulpit, the press echoed the general joy; provinces and families gave thanks to God. England, too, which had shared the despondency of Wolfe, triumphed at his victory, and wept for his death. Joy, grief, curiosity, amazement were on every countenance." The surrender of Quebec virtually decided the contest in America, though it continued in Europe and on the ocean till 1763, when by the treaty of Paris Canada and its dependencies were formally ceded to Great Britain. Among these dependencies were several stations on the great lakes, and little stockade posts between the lakes and the Ohio and in the valley of that river. The transfer of these posts from the friendly and conciliatory French to the hostile and domineering English greatly excited the Indians in that region; and soon after the close of the war Pontiac, a chief of distinguished courage and ability, persuaded the Ottawas, Miamis, Wyandots, Chippewas, Potawatomes, Shawnees, Foxes, Winnebagoes, and other Algonquin tribes to engage in a conspiracy against the conquerors, which broke out in June, 1763. Within a fortnight all the forts west of Oswego were taken by the Indians, except Niagara, Pittsburg, and Detroit. The garrisons were nearly all put to death, more than 100 traders were murdered, and more than 500 families butchered or driven from their homes. Detroit was besieged for 6 months, but was finally relieved, and the Indians were compelled to sue for peace. Pontiac, however, refused to submit, and wandered toward the Mississippi, stirring up the tribes of the west against the English, till his career was ended by assassination in 1769.—The termination of the 7 years' war left the colonies poor and exhausted, for their contributions in men

and money had been very large, and they had suffered severely from the enemy during the mismanagement of the first half of the contest. Nevertheless they had gained greatly by the struggle. The conquest of Canada, of Louisiana, and of the military posts on their western frontier, extinguished their chief source of anxiety and danger, and freed them for ever from any serious dread of the Indians, who were really formidable only when supported by the French. Then, too, the incapacity of the English generals and the defeats sustained by large bodies of English troops had materially weakened their superstitious reverence for the power of the mother country, while their own exploits in the war had given them a confidence in their strength hitherto unfelt. At this period the population of the colonies was estimated at 2,500,000, of whom 500,000 were negro slaves. The general characteristics of the people were intelligence, industry, and a high degree of moral and religious culture. They were descended for the most part from intelligent and enterprising ancestors, who had emigrated from the old world either to secure to themselves greater freedom to worship God or better opportunities to acquire competence or wealth. The passage across the Atlantic was tedious and expensive, and life in the new settlements hard and perilous. The lazy, the timid, the imprudent, the brutally ignorant, shrank from the terrors of the sea and the wilderness, and the vast majority of the emigrants were of the respectable and energetic middle class. Religious influences operated powerfully, not only in giving an impulse to emigration, but on the character of the emigrants in their new homes; and not only on the Puritans, Huguenots, and Quakers, who came avowedly from the highest motives, but on vast bodies of churchmen, Dutch Calvinists, and Scotch-Irish Presbyterians. Much care was devoted to the education of children, and especially to training them in a knowledge of the Bible and the catechism, and in reverence for the sabbath. In Virginia the laws enacted that in every settlement there should be "a house for the worship of God." Absence from church was punished by a fine, and travelling or shooting on the sabbath was forbidden. In the Carolinas there were similar laws, and in Pennsylvania acts were passed against "stage plays, playing of cards, dice, May games, masques, and balls." Similar also was the legislation of the New England colonies, where in addition at some periods sumptuary laws and laws regulating the use of tobacco were in force. The spirit of political freedom was strongly developed among the colonists, and republican ideas and feelings transmitted from the period of the commonwealth in England were widely diffused, though at the same time a warm attachment existed for the mother country and a devoted loyalty to the crown. This attachment was disinterested, for though England afforded protection during the wars with the French, these wars, with the

single exception of that recently concluded, had originated in Europe, and were waged for objects with which America had neither concern nor sympathy. In many other respects the connection was injurious to the colonies. Their trade and manufactures were systematically restricted for the selfish benefit of England; but though these oppressive enactments were heavily felt by the colonists, they made no resistance so long as the imperial authority confined itself to measures which, however harsh or injurious, were not clearly unconstitutional. But in 1761 parliament authorized sheriffs and officers of the customs to use "writs of assistance" or general search warrants which empowered them to enter stores and private dwellings and search for merchandise which it was suspected had not paid duty. These writs were first used in Massachusetts, where they roused great excitement and opposition. Obedience was refused to them on the ground of illegality, and a trial ensued in which the eloquent James Otis, the advocate-general of the crown, refused to defend them, but resigned his office and appeared in behalf of the people. His speech made a profound impression. "Otis was a flame of fire," says John Adams; "he carried away all before him. American independence was then and there born. Every man of an immense crowded audience appeared to me to go away, as I did, ready to take arms against the writs of assistance." The judges evaded a decision, and the writs, although secretly granted, were never executed. In Virginia two years later occurred a collision between the royal prerogative and the colonial legislation on the subject of dues to the clergy, in which the cause of the colony was defended by Patrick Henry, a young man of 27 years, who then first displayed the eloquence which has made his name so celebrated. It was at length decided in England to tax the colonies directly in spite of all their protests, and the stamp act passed the house of commons March 22, 1765, by a vote of 9 to 1, and 10 days later passed the house of lords almost unanimously and received the signature of George III. This act declared that every document used in trade, to be valid, must have affixed to it a stamp, the lowest in value costing a shilling, and thence increasing indefinitely in proportion to the value of the writing. To enforce the act, against which while under discussion the colonies had vehemently remonstrated, parliament authorized the ministry to send as many troops as they saw proper to America, for whom the colonies were required to find "quarters, fuel, cider or rum, candles, and other necessaries." These acts created great excitement and indignation in America. The Virginia assembly passed resolutions, introduced by Patrick Henry, declaring that the people of that colony were only bound to pay taxes imposed by their own legislature. The legislature of Massachusetts resolved that the courts should conduct their business without the use of stamps.

In New York and Pennsylvania the opposition, though not so general, was yet very strong. Everywhere the people determined not to use the stamps, and associations calling themselves "Sons of Liberty" were organized in opposition to the act and for the general defence of the rights of the colonies. So powerful were these combinations, and so intense the popular indignation, that when the day came (Nov. 1) on which the obnoxious law was to go into effect, it was found that all the stamp distributors had resigned their offices. Meantime in June the Massachusetts legislature issued a circular inviting all the colonies to send delegates to a congress at New York on the first Tuesday of October. On that day delegates from 9 of the colonies appeared. The congress drew up a declaration of rights, a memorial to parliament, and a petition to the king, in which they claimed the right of being taxed only by their own representatives. The colonial assemblies approved the proceedings of the congress, and thus for the first time in their history a federal union was formed among the American colonies. On Nov. 1, the day on which the stamp act went into operation, the bells throughout the country were tolled and the flags lowered to half mast to indicate "the funeral of liberty." The merchants of the principal cities agreed to purchase no more goods in England till the act was repealed, and the people pledged themselves to use no articles of English manufacture. These demonstrations of popular feeling in America led parliament to consider the repeal of the act. Animated debates took place, in which Pitt and Burke advocated the repeal. "I rejoice that America has resisted," said Pitt; "if they had submitted, they would have voluntarily become slaves. They have been driven to madness by injustice. My opinion is that the stamp act should be repealed, absolutely, totally, immediately." The house of commons called to their bar, among other witnesses, Benjamin Franklin, to testify to the temper of his countrymen. Franklin told them that the colonists could not pay for the stamps for want of gold and silver; that they had borne more than their share of expense in the last war, and were still pressed by the debts contracted under it; that they were well disposed toward the mother country, but that the acts of parliament were lessening their affection, and unless those acts were repealed all commerce between them and the mother country would be broken up; and finally that they never would submit to taxes imposed by those who had no authority. These representations had due weight, and on March 18, 1766, the stamp act was repealed, and the repeal was celebrated with great rejoicings both in the colonies and in the English seaports, whose trade was already seriously affected. The plan of taxing America, however, was not yet given up, and in 1767 parliament passed an act, which received the royal assent June 29, imposing duties on paper, glass, tea, and some other articles imported

into the colonies. The colonists in return revived with renewed vigor their non-importation associations. Massachusetts, and especially the town of Boston, was foremost in the opposition; and in Boston, on the occasion of the seizure of a sloop belonging to John Hancock, on whose cargo duties were demanded, a mob attacked the commissioners of customs and forced them to fly to the fort in the harbor for safety. The government resolved to take vengeance on "the insolent town of Boston," and a military force under Gen. Gage was sent to occupy the place in September. A collision took place, March 5, 1770, between the soldiers and a crowd of citizens, in which 3 of the latter were killed and 5 wounded. This "Boston massacre," as it was called, caused great excitement throughout the country, and had much influence in heightening the popular feeling against England. The soldiers who had fired were tried for murder. Two of the most distinguished of the popular leaders, John Adams and Josiah Quincy, disapproving like the vast body of the people of any resort to violence, and resolved that the struggle should be carried on purely by legal and constitutional means, undertook to defend them; and it appearing on evidence that they had fired after provocation, they were acquitted by the jury, except two, who were found guilty of manslaughter. The Virginia assembly approved the course of Massachusetts, and passed resolutions to that effect presented by Washington, and signed by him and Patrick Henry, George Mason, Thomas Jefferson, Richard Henry Lee, and all the other members. The non-importation associations of the Americans soon produced such an effect in England, that the government at length removed all the duties except that of threepence a pound on tea, which was retained at the express command of the king, who said "that there should be always one tax, at least, to keep up the right of taxing." This, however, did not satisfy the Americans, who objected not to the amount of the taxes, but to the principle of taxation without representation; and combinations were formed against the importation and use of tea, and measures taken to prevent its being either landed or sold. In Philadelphia a public meeting denounced as an enemy to his country "whosoever shall abet in unloading, receiving, or vending the tea." Similar meetings with similar resolutions were held in Charleston and New York. At Boston, on the receipt of news that ships laden with tea were on the ocean bound for that port, 5,000 men assembled on Nov. 3, 1778, and on motion of Samuel Adams resolved unanimously to send the tea back. Three ships arrived, and the consignees, yielding to the popular will, agreed to send them back if the governor, Hutchinson, would consent. The governor, though a native of the colony, was peculiarly odious from the fact that a number of his letters to England, privately instigating the ministry to pursue their oppressive course, had fallen into

the hands of Dr. Franklin and been made public. He refused to permit the ships to leave the port, and the people took the matter into their own hands. On the night of Dec. 16 a band of men disguised as Indians went aboard the tea ships, which lay at one of the wharfs, and, taking out the chests, emptied tea into the water, and then quietly retired. When the news of this action reached England, the government determined to punish the colonies, and especially to make an example of Boston. Parliament accordingly passed the "Boston port bill," which closed that port to all commerce, and transferred the seat of colonial government to Salem. Bills were also passed for quartering soldiers at the people's expense on all the colonies, and enacting that officers who should be prosecuted for enforcing this law should be taken to England for trial. These acts, which were held to be gross violations of the charters and privileges of the colonies, excited to a still greater pitch the already deep indignation of the people. Boston was everywhere regarded as the champion of popular rights, and as the victim of ministerial persecution. Salem refused to become the seat of government, and Marblehead offered her port free of charge to the Boston merchants. The most distant colonies, and even the remote backwoods beyond the Alleghenies sent money and provisions to the relief of the poor of the proscribed town. Quebec sent 1,000 bushels of wheat, and even in London £30,000 was subscribed for them. Hutchinson was superseded as governor of Massachusetts in May, 1774, by Gen. Gage, who, though personally popular, vainly strove to repress the revolutionary ferment that agitated Boston. The whigs, as those of the popular party were called, in contradistinction to the Tories or royalists, carefully restrained their agitation within legal and constitutional bounds; and though Faneuil hall and the Old South church rang almost continually with the eloquence of their orators and the tumult of their meetings, nothing was done of which the British authorities could take hold. Meanwhile in all the colonies conventions were held and delegates chosen to the congress at Philadelphia, known as the "old continental congress," which met Sept. 5, to the number of 55 delegates, representing all the colonies except Georgia. Among the members were Washington, Patrick Henry, Richard Henry Lee, Edward and John Rutledge, Christopher Gadsden, Samuel Adams, John Adams, Roger Sherman, Philip Livingston, William Livingston, John Jay, and Dr. Witherspoon, president of Princeton college. For eloquence Patrick Henry was unrivalled; next to him John Rutledge was the ablest in debate: "but if you speak of solid information and sound judgment," said Patrick Henry, "Washington was unquestionably the greatest man of them all." Peyton Randolph of Virginia was chosen speaker, and Charles Thomson of Pennsylvania secretary. The discussions were open-

ed by Patrick Henry in a speech of surpassing eloquence, in which he said: "British oppression has effaced the boundaries of the several colonies; the distinctions between Virginians, Pennsylvanians, New Yorkers, and New Englanders are no more. I am not a Virginian, but an American." A declaration of rights was agreed upon, in which was set forth the claim of the colonists as British subjects to participate in making their own laws and in imposing their own taxes, to the right of trial by jury in the vicinage, of holding public meetings, and of petitioning for redress of grievances. The maintenance of a standing army in the colonies without their consent was protested against, as were eleven acts passed since the accession of George III. in violation of colonial rights and privileges. The measures of redress which they proposed were peaceable, and comprised the formation of an "American association," pledged not to trade with Great Britain or the West Indies, nor with those engaged in the slave trade, and not to use British goods or tea. Among the papers issued by them were a petition to the king and an address to the people of Canada, written by John Dickinson of Pennsylvania; an address to the people of Great Britain, by John Jay; and a memorial to the people of the colonies, by Richard Henry Lee. When these documents reached England, William Pitt, now become earl of Chatham, said of them: "For myself, I must avow that in all my reading—and I have read Thucydides and I have studied and admired the master states of the world—for solidity of reason, force of sagacity, and wisdom of conclusion, under a complication of difficult circumstances, no nation or body of men can stand in preference to the general congress at Philadelphia. The histories of Greece and Rome give us nothing equal to it, and all attempts to impose servitude upon such a mighty continental nation must be vain." The merchants, tradesmen, and in fact a majority of the people of England, had more or less sympathy with the Americans; and even Lord North, the prime minister, by whom the obnoxious measures against the colonies were carried through parliament, in his secret heart disapproved of them, as is now known, and only remained in office and carried out the oppressive and hostile acts at the express request of the king, who was obstinately bent upon compelling the Americans to obedience by military force. Perceiving a conflict to be almost inevitable, the people of the colonies began to prepare earnestly for war, and in Massachusetts nearly all men able to bear arms were trained daily in military exercises, and engaged to take the field at a moment's notice, whence originated their name of "minute men." Gen. Gage, who had received some additions to his forces, became alarmed, and began to fortify Boston neck, and to seize all the arms and ammunition he could lay hands on in the surrounding towns. Small stores of arms and ammunition had been accumulated by the provincial government of Massachusetts at Worcester and at Concord. Gage, on the night of April 18, 1775, secretly despatched a large force to destroy the stores at Concord. The movements of the British were however vigilantly watched, and the minute men were roused in every direction by messengers and signals from Boston. At Lexington, half way between Boston and Concord, the first blood of the revolution was shed. Major Pitcairn ordered the soldiers to fire upon the citizens who appeared in arms upon the common, and 8 were killed and several wounded. The British proceeded to Concord, and destroyed some stores, but met with such resistance at the north bridge over Concord river that they were forced to retreat, and, hotly pursued by the Americans, made their way back to Boston with a loss of 273 killed and wounded. "This," says Bancroft, "is the world-renowned battle of Concord, more eventful than Agincourt or Blenheim." It brought the political contest between the colonies and England to a summary ending, and inaugurated the war of the revolution. "Before the 19th of April, 1775," relates Jefferson, "I never had heard a whisper of a disposition to separate from Great Britain." Six months before, in Oct. 1774, Washington wrote: "No such thing as independence is desired by any thinking man in America;" and little more than a month before the battle John Adams had publicly declared in Boston: "That there are any who pant after independence is the greatest slander on the province." The tidings of the fight spread with wonderful rapidity while it was going on, and everywhere throughout New England the people sprang to arms. The night preceding the outrages at Lexington, there were not 50 people in the whole colony who ever expected that any blood would be shed in the contest; the night after, the king's governor and the king's army found themselves closely beleaguered in Boston. The provincial congress of Massachusetts on April 22 resolved unanimously that a New England army of 80,000 men should be raised, of which the quota of Massachusetts should be 18,600. Before the end of the month 20,000 men were encamped around Boston. As the news from Concord and Lexington spread westward and southward, the people everywhere rose in arms, and before the close of summer the power of all the royal governors from Massachusetts to Georgia was at an end. Not only before Boston, but on the remotest frontiers, the New Englanders acted with spirit and energy. Volunteer expeditions from Connecticut and Vermont, led by Benedict Arnold and Ethan Allen, seized the important fortresses of Ticonderoga and Crown Point, whose cannon and ammunition were of incalculable value to the poorly equipped forces of America. Equally bold steps were taken in Virginia, South Carolina, and Georgia; while in North Carolina a convention assembled at Charlotte, Mecklenburg co., in May, 1775, proclaimed their con-

stituents absolved from all allegiance to the British crown, and organized a local government with preparations for military defence. The second continental congress assembled May 10 at Philadelphia. Among the members were Franklin, Hancock, Samuel Adams, John Adams, Washington, Richard Henry Lee, Patrick Henry, Jay, George Clinton, and Robert R. Livingston. Hancock, who with Samuel Adams had been proscribed as a rebel, was elected president. Conservative and moderate to the last, the congress sent yet another petition to the king, denying any intention of separation from England, and asking only for redress of grievances; but at the same time they formed a federal union of the colonies, and assumed the central authority of the nation. They took measures to raise an army, to equip a navy, and to procure arms and ammunition. Bills of credit to the amount of \$2,000,000 were issued, for whose redemption the faith of the "united colonies" was pledged. The forces before Boston were adopted as the continental army, and at the suggestion of the New England members Washington was nominated and unanimously chosen as commander-in-chief. Before he could reach the seat of war important events occurred. The British army in Boston had received large reinforcements, led by Generals Howe, Burgoyne, and Henry Clinton, who formed the plan of seizing and fortifying Bunker hill in Charlestown. The American generals, informed of this project, frustrated it by despatching a force under Col. William Prescott, who interpreted his instructions to mean Breed's hill, which more fully than Bunker hill commanded Boston harbor. A redoubt hastily thrown up in the night met the eyes of the British at daybreak on the morning of June 17, and immediate preparations were made for its assault. Three thousand veteran soldiers were landed, and, after being twice repulsed by about half their number of imperfectly armed Americans, and after the ammunition of the latter was exhausted, carried the works with a loss, according to their own account, of 1,054 men killed and wounded. The American loss was 449 killed, wounded, and prisoners. Among the killed was Gen. Joseph Warren of Boston, one of the ablest, most eloquent, and most popular of the patriot leaders. The battle of Bunker hill was the first great conflict of the revolution, and, though nominally a defeat, soon came to be universally considered a victory of the Americans, on whose opinion of their own ability to meet the British soldiers in open fight it had a favorable influence that was felt throughout the war. Four days after the battle Washington, accompanied by Charles Lee, who had been made a major-general, started from Philadelphia for the seat of war, where on his arrival he was received with great enthusiasm by the army. Beside Lee, Philip Schuyler of New York, Artemas Ward of Massachusetts, and Israel Putnam of Connecticut had been elected major-generals.

Horatio Gates, Seth Pomeroy, Richard Montgomery, David Wooster, William Heath, Joseph Spencer, John Thomas, John Sullivan, and Nathaniel Greene were chosen brigadiers. The army was unorganized, undisciplined, poorly clad, imperfectly armed, and almost destitute of powder. With the aid of Gates, who alone of the generals had had much experience in war, Washington brought the troops into tolerable order, and regularly beleaguered Boston till March 17, 1776, when the British evacuated the city and sailed for Halifax, carrying with them a large body of loyalists. Meantime the invasion of Canada, whose inhabitants were reported to be disaffected to British rule, was decided upon by congress, and carried out with insufficient forces under command of Gen. Montgomery. Montreal was taken, and Quebec was attacked Dec. 31, 1775, in its upper part, by one portion of the army led by Montgomery, while another under Arnold assailed it in the lower at the same time. The assault was conducted with great courage and energy, but was repulsed and Montgomery slain and Arnold severely wounded. After a blockade of the city continued for some months the Americans, whose forces were totally inadequate in numbers and equipments to the enterprise, on the arrival of powerful reinforcements to the British, abandoned the province in June, 1776. During this period the British fleets and cruisers hovered on the coast, attacking various points; among others, Falmouth (now Portland), Me., which they burned, and Charleston, S. C., where they were repulsed with great loss by a small force in Fort Sullivan, commanded by Col. Moultrie. In all these operations the Americans were greatly impeded by want of powder and other munitions of war. Cruisers, however, were fitted out by order of congress and by some of the colonies, and several of the British supply ships were opportunely captured. Congress also appointed a secret committee to import supplies from the West Indies, and took measures to establish powder mills and cannon foundries. They also appointed a naval committee with authority to build 18 frigates, which may be considered the foundation of the navy department of the United States. A secret committee appointed to correspond privately with the friends of the colonies in Europe may be regarded likewise as the germ of the state department. A financial committee and a war committee had already been instituted, and thus the main departments of the government of the united colonies were put in operation. The success of the colonial armies at Boston and at Charleston, and the courage committed by British commanders on the coast and in Virginia, greatly stimulated the feeling in favor of independence, which Samuel Adams and a few others had desired from the beginning of the contest; and a powerful impulse was given to this sentiment by the "Common Sense" of Thomas Paine, which was issued

about the beginning of 1776 and widely circulated. On June 7 Richard Henry Lee introduced a resolution into congress declaring "that the united colonies are and ought to be free and independent states, and that their political connection with Great Britain is and ought to be dissolved." After an animated discussion, the resolution passed by the votes of 9 colonies. Pennsylvania and South Carolina voted against it, Delaware was divided, and New York did not vote. Franklin, Jefferson, John Adams, Roger Sherman, and Robert R. Livingston were chosen a committee to draft a declaration of independence, which was written by Jefferson, and was adopted on July 4 by the vote of the 13 colonies, which thus became the United States of America. "The declaration was not only the announcement of the birth of a people," says Bancroft, "but the establishment of a national government; a most imperfect one, it is true, but still government, in conformity with the limited constituent powers which each colony had conferred upon its delegates in congress. The war was no longer a civil war; Britain was become to the United States a foreign country. Every former subject of the British king in the 13 colonies now owed primary allegiance to the dynasty of the people, and became citizens of the new republic; except in this, every thing remained as before; every man retained his rights; the colonies did not dissolve into a state of nature, nor did the new people undertake a social revolution. The affairs of internal police and government were carefully retained by each separate state, which could, each for itself, enter upon the career of domestic reforms. But the states, which were henceforth independent of Britain, were not independent of one another; the United States of America assumed powers over war, peace, foreign alliances, and commerce." Soon after the evacuation of Boston by the British, Washington had transferred his army to the city of New York, which it was feared would be the next object of attack. On June 28 a fleet from Halifax, bearing Gen. Howe and the late garrison of Boston, entered New York harbor, and landed the forces on Staten island. A few days later arrived Admiral Lord Howe, to whom, in conjunction with his brother Sir William, the king had intrusted the control of American affairs. He issued a circular offering pardon to those who would lay down their arms and submit to the royal mercy. As the Americans had committed no crime in maintaining their rights, they had no need for pardon; and congress ordered the circular to be published in all the newspapers to show the people that the king meant to concede nothing, and that they must either fight or be slaves. The mission of Lord Howe came to nothing, and both sides prepared with vigor for the prosecution of hostilities. The British government, unable to recruit the army to the desired number from its own people, who disapproved the war, had hired from

the German princes, and especially from Hesse-Cassel, large bodies of mercenaries; and with these and fresh troops brought from the south by Sir Henry Clinton, the force on Staten island was augmented to 80,000 men. Washington's army was much less in numbers, and every way inferior in supplies and equipments. The campaign began on Long island, where on Aug. 27 the Americans were defeated with heavy loss, and forced to abandon that island, and soon after the city of New York and the lower Hudson. A series of disasters ensued, and at the end of the year Washington had been compelled to retreat beyond the Delaware at the head of fewer than 4,000 men, poorly clad, half starved, and destitute of blankets and tents. The cause of freedom looked desperate, and great discouragement prevailed throughout the country. Washington, however, was firm and undaunted. He declared to Gen. Mercer that, even if driven beyond the Alleghanies, he would stand to the last for liberty and independence. While these disasters were occurring between the Hudson and the Delaware, the British seized and held the island of Rhode Island, and at Baskingridge, N. J., captured Gen. Charles Lee, who was esteemed one of the best officers in the army, though it is now known that he was treacherous to the cause, and had been for some time before his capture disposed to an accommodation with the enemy. The army under Washington was reduced by losses in battle and by the expiration of enlistments to about 8,000 men, and in the general despondency numbers of the people abandoned the cause as hopeless, and accepted the British commander's offers of pardon and amnesty. Washington, however, maintained his fortitude and confidence in final success, and vigilantly watched for an opportunity to retrieve the credit of the American arms. The indolence and caution which were prominent traits in the character of Gen. Howe, the British commander-in-chief, prevented him from crushing as he might have done the weakened remnant of Washington's army, and gave time to the daring and enterprising American to strike a severe blow at his over-confident antagonist. On the night of Dec. 25 Washington crossed the Delaware in open boats despite the snow and ice, and falling upon the British forces at Trenton captured 1,000 Hessians. A few days later (Jan. 8, 1777) he defeated the enemy again at Princeton, taking several hundred prisoners. These exploits revived the spirits of the nation, and confounded and dismayed the enemy. Congress had manifested unusual firmness in this trying period, had invested Washington with almost dictatorial powers, and had taken measures for raising an army for three years instead of for one. It now formed articles of confederation between the states (which were ratified by all except Maryland in 1778-'9), and sent agents to Europe to solicit aid from foreign powers. When the campaign opened in the spring of 1777,

Washington's force had increased to 7,000 men. Gen. Howe, after vainly attempting to bring on a general engagement, withdrew his forces from New Jersey to Staten island, and afterward sailed with 18,000 men for the Chesapeake, where he landed on Elk river and threatened Philadelphia. To defend the capital Washington was forced to give battle on the Brandywine, Sept. 11, but was overpowered by superior forces and compelled to retreat with the loss of nearly 1,000 men. Lafayette, who had recently entered the service of the United States as a volunteer, and had been made a major-general, was severely wounded on this occasion. A few days later the British took possession of Philadelphia without opposition, congress retiring first to Lancaster and afterward to York, Penn. On Oct. 4 Washington made an attack on the British at Germantown, 7 miles from Philadelphia, but was repulsed with heavy loss; and soon afterward both armies went into winter quarters. The want of success in the middle states was more than counterbalanced by victories in the north. A British army 7,000 strong, beside Canadians and Indians, commanded by Gen. Burgoyne, advanced from Canada by Lake Champlain, and took Ticonderoga and Skenesborough, now Whitehall. From Fort Edward, on the upper Hudson, strong detachments were sent to Bennington, Vt., to destroy a collection of stores, but were met and defeated with the loss of 600 men by the Vermont and New Hampshire militia led by Gen. Stark. Burgoyne made his way through the woods to Saratoga, where he was encountered by Gen. Gates, who had recently been placed in command of the army in the northern department; and on Sept. 19 an indecisive engagement was fought at Stillwater, in which the British lost about 600 men. On Oct. 7 a second battle was fought on nearly the same ground, in which the Americans had the advantage; and 10 days later Burgoyne with his whole army capitulated on favorable terms. The consequences of this victory were of the highest importance at home and abroad. At home, it inspired the people with confidence; it depressed the tories or loyalists, who in some of the states were yet numerous, and raised the bills issued by congress 20 per cent. in value. Abroad, the victory of Saratoga had an equally favorable effect. From the beginning of the conflict the French government had secretly encouraged the revolt of the colonies, and had furnished them with supplies of arms and military stores, without which it would have been almost impossible to carry on the war. Franklin, Silas Deane, and Arthur Lee had been sent by congress as commissioners to France shortly after the declaration of independence, but received no open countenance from the court till after the surrender of Burgoyne. That event, and the prospect it opened of final success to the Americans, decided the negotiations in their favor; and in Feb. 1778, treaties of alliance and of amity and commerce

were signed at Paris. Alarmed at this alliance and at the fate of their northern army, the British ministry introduced into parliament two bills, which were passed March 11, 1778, repealing all the acts obnoxious to the Americans, and subsequently three commissioners were sent with authority to negotiate terms of reconciliation. Congress, however, finding that these bills made no mention of the independence of the colonies, rejected them, and refused to treat with the commissioners and Great Britain should agree to withdraw her fleets and armies. Washington went into winter quarters about the middle of Dec. 1777, at Valley Forge, 20 miles north of Philadelphia, his half clad and scantily fed soldiers marching many of them without shoes, and leaving bloody footprints on the snow. They suffered dreadful hardships during the extremely severe winter of 1777-'8, but in the spring were cheered with the tidings of the alliance and assistance of France, in whose honor on May 7 they fired salutes amid huzzas for King Louis XVI. A month later a French fleet under Count D'Estaing, which had been sent to blockade the British fleet in the Delaware, reached the coast; but a few days before its arrival the enemy's vessels had sought refuge in Raritan bay. Sir Henry Clinton, who succeeded Howe as commander-in-chief of the British, evacuated Philadelphia in June, and with 11,000 men began on the 18th his march toward New York. Washington pursued with a nearly equal force, and on the 28th the two armies engaged in battle on the plains of Monmouth, near the village of Freehold, N. J. The action was not decisive, but the Americans remained masters of the field, while the British retreated to New York and remained inactive for the rest of the summer. An attempt made in August with the assistance of the French fleet to drive the British from Rhode Island proved a failure, and D'Estaing, without having accomplished any thing of importance, sailed for the West Indies. At the close of the campaign of 1778 the position of the British was not at all advanced from that which their forces held in 1776. They occupied nothing but Rhode Island and the island of Manhattan, while the Americans had gained largely in knowledge of the art of war, and had secured the powerful alliance of France and the sympathies and secret assistance of the Spanish court. Little practical benefit, however, had been gained from the mismanaged operations of the French fleet, and great embarrassment was felt from the wretched condition of the national finances, the continental money issued by congress having depreciated to a very low point. In this emergency the patriotism and the financial skill and credit of Robert Morris were of the highest value to the government, which without his aid could scarcely have continued in existence. In 1779 the principal theatre of war was at the south, where Gen. Benjamin Lincoln commanded the Americans. Toward the end of 1778 Gen.

Clinton had sent an expedition to Georgia, which defeated the American forces at Savannah, and took possession of the city, Dec. 29. The British were successful in several subsequent engagements, and by the middle of summer, 1779, Georgia was conquered and completely possessed by them. An attack on Savannah, made by Lincoln with the coöperation of the French fleet in September, was repulsed with the loss to the allies of 1,000 men, among them Count Pulaski. During this summer Lafayette had visited France, and chiefly through his efforts the French government had agreed to send another fleet and an army to the assistance of the Americans. The British ministry, informed of this expedition, ordered Clinton to withdraw his troops from Rhode Island and concentrate all his forces at New York. England in fact was becoming involved in difficulties of an alarming character. Spain had declared war against her, June 16, 1779, and a French and Spanish armament threatened an invasion, while French and American cruisers hovered on her coasts, insulting her ports and harassing her commerce. The famous Paul Jones, commanding an American frigate, captured on Sept. 23 two British ships of war, in one of the most desperate naval battles ever fought. During the whole war in fact Paul Jones was actively employed against the enemy on the sea, and, together with a swarm of privateers from New England, inflicted immense loss on the mercantile marine of England. About the beginning of 1780 Clinton, leaving the Hessian general Knyphausen in command at New York, sailed south with the main body of the British army to carry the war into the Carolinas. Charleston was besieged for several weeks, and Gen. Lincoln after a feeble defence surrendered May 17, with a garrison of 2,500 men. The rest of the state of South Carolina was overrun by detachments of the British, and nominally submitted to the restoration of the royal authority, so that Clinton, deeming his conquest complete, sailed for New York June 5, leaving Lord Cornwallis in command. Very soon, however, the patriots, though unable to take the field in force, renewed the contest as guerillas under the command of Sumter, Marion, Pickens, and other daring partisan leaders, and continually harassed not only the British but the Tories, of whom there were great numbers in the state. To recover South Carolina, congress sent Gen. Gates, whose capture of Burgoyne's army at Saratoga had given him a higher reputation than he deserved. On his first encounter with Cornwallis at Camden, Aug. 16, he was routed with the loss of nearly 1,000 men, among them Baron De Kalb, a French officer of experience, who was second in command. Gates with the remnant of his force fled to North Carolina, and at the close of the summer there remained no Americans in arms in South Carolina except a small band under Marion. Within three months two American armies had been de-

stroyed, while the most formidable of the partisan bands, that of Sumter, had been dispersed by Col. Tarleton. Early in September Cornwallis marched into North Carolina, where on Oct. 7, at King's mountain, a detachment from his army was totally defeated by the militia, who killed and captured upward of 1,200 of the enemy. This serious reverse, and the renewed activity of Marion, Pickens, and other partisan leaders, induced Cornwallis in October to withdraw to South Carolina. During the summer the only military operation of importance in the north was an irruption of the British into New Jersey, from which, after vainly endeavoring to draw Washington with his inferior forces into a general engagement, and receiving from Gen. Greene a severe defeat at Springfield, June 23, they retired to their strong position at New York. A few days later, July 10, a French fleet arrived at Newport, bringing the count de Rochambeau and 6,000 soldiers to the assistance of the Americans. Washington went to Hartford in September to confer with the French officers, and during his absence it was discovered that Benedict Arnold, who commanded the important fortress of West Point, had engaged in treasonable correspondence with the enemy, and had agreed to deliver that stronghold and its dependencies into the hands of Sir Henry Clinton. The traitor Arnold escaped, but Major André, the British officer who communicated with him, was caught and hanged as a spy. The end of the year was marked by a declaration of war from Great Britain against Holland, on discovering that the Dutch government was secretly negotiating a treaty of alliance with the United States. The principal military operations of the campaign of 1781 were in the south, where Greene had been made commander in place of Gates. At Cowpens, S. C., on Jan. 17, Gen. Morgan won a brilliant victory over the British under Col. Tarleton. On March 15, at Guilford Court House, N. C., a battle was fought in which the British gained some advantage; but in September they were defeated at Eutaw Springs in a bloody action which nearly terminated the war in South Carolina. At the close of the year the British in the states south of Virginia were confined to Charleston and Savannah. In Virginia Cornwallis, who was opposed by Lafayette, Wayne, and Steuben, had fortified himself at Yorktown, where he had gathered a considerable army. Meanwhile the American army of the north under Washington, and the French army of Count de Rochambeau, had formed a junction on the Hudson for the purpose of attacking the British in New York. This plan however was suddenly changed, and while the British commander, Sir Henry Clinton, was kept from sending aid to Cornwallis by apprehensions that New York was still threatened, the allied army was far on its way toward Yorktown, where it arrived about 12,000 strong, Sept. 28, 1781, and began a regular siege, which lasted

till Oct. 19, when Cornwallis surrendered with his whole force of 7,000 men. This victory substantially terminated the contest, and secured the independence of America. In England Lord North received the intelligence "as he would have done a cannon ball in his breast," exclaiming: "O God! it is all over! it is all over!" He and his administration were forced to retire from power, March 20, 1782, and give way to a cabinet opposed to the further prosecution of the war. Orders were sent to the British commanders in America to cease hostilities, and on July 11, 1782, Savannah was evacuated, and Charleston on Dec. 14. Adams, Franklin, Jay, and Laurens were appointed by congress commissioners to negotiate for peace; and at Paris, on Nov. 30, 1782, they signed a preliminary treaty, and on Sept. 8, 1783, a definitive treaty, by which the United States were formally acknowledged by Great Britain to be free, sovereign, and independent. New York, the last position held by the British on our coast, was evacuated Nov. 25, 1783. Thus ended a war which, in the language of the younger Pitt, "was conceived in injustice, nurtured in folly, and whose footsteps were marked with slaughter and devastation. The nation was drained of its best blood and its vital resources, for which nothing was received in return but a series of inefficient victories and disgraceful defeats; victories obtained over men fighting in the holy cause of liberty, or defeats which filled the land with mourning for the loss of dear and valuable relations, slain in a detested and impious quarrel." In the 7 years of the revolutionary war Great Britain sent to America 112,584 soldiers and more than 22,000 seamen. The forces raised by the United States during the same period consisted of 230,000 continental soldiers and about 56,000 militia. At the close of the war serious trouble broke out with the army concerning the payment of the arrears of their wages and rations. The paper money issued by congress, in which the troops were paid, had so depreciated as to be of little value, and, the treasury being empty payment in gold and silver was almost out of the question. The wide-spread disaffection among the soldiers was greatly fomented by an address written by Major John Armstrong, which in March, 1783, was circulated in the camps at Newburg, N. Y., urging the army to take matters into their own hands and compel congress and the people to do them justice. The great influence of Washington, however, was promptly exerted, and successfully allayed this alarming discontent; and congress soon after satisfied the troops by partially paying their claims. On Nov. 2 Washington issued a farewell address to the armies of the United States, and, after taking leave on Dec. 4 of his officers at New York, proceeded to Annapolis, Md., where congress was then in session, and on Dec. 23 resigned his commission as commander-in-chief and retired to his estate at Mount Vernon.—It was soon found that the

articles of confederation adopted in 1777 did not form a sufficient constitution for the nation and that they were especially deficient in relation to the subjects of legislation which concerned the whole country, such as the regulation of commerce, the common defence, the adjustment of controversies between the states, and the making of treaties with foreign nations. Some of the states passed laws which conflicted with those of other states; some levied duties on merchandise at the expense of their neighbors; and adjacent ports in different states competed with each other by lowering the rate of imposts, as congress had no authority to regulate commerce or to legislate for the whole country. These and other evils flowing from the absence of a powerful general government grew at length so burdensome, that a national convention was called, which met at Philadelphia May 14, 1787, and after 4 months' deliberation adopted the present constitution of the United States, and submitted it to the people for ratification. After a thorough discussion, lasting in some of the states for 2 or 3 years, the constitution was accepted by all of them: first by Delaware, Dec. 7, 1787, and lastly by Rhode Island, May 27, 1790. When two thirds of the states had adopted the constitution, it became valid, and went into operation March 4, 1789. New York was designated as the capital, and it was that city Washington, who was unanimously chosen the first president, was inaugurated on April 30, with John Adams as vice-president. He appointed Jefferson secretary of state, Hamilton of the treasury, and Henry Knox of war. The beneficial influence of the new government was immediately felt in the restoration of public confidence, the revival of commerce, and the general prosperity of the country. A system of finance, advocated in an able report by Hamilton, was adopted, and the debts of the late confederacy and of the individual states were assumed by the general government. A bank of the United States was incorporated, which began its operations in Feb. 1794, and a mint was established at Philadelphia. In the summer of 1790 an Indian war of an unusually formidable character was waged by the tribes of the northwest, who, after inflicting several defeats on Gens. Harmer and St. Clair, were finally quelled by Gen. Wayne, and peace was restored in Aug. 1795. The great revolution in France, which broke out at the beginning of Washington's administration, was powerfully felt in its principles and effects in this country. Claims for assistance were made upon the United States, and a large part of the people, in their intense sympathy with the French republic and hostility to England, would have gladly seen the United States actively engaged in the quarrel which raged beyond the Atlantic. Two parties had already been formed, viz.: the federalists, composed of those who favored the maintenance of the constitution just as it was; and the republicans or democrats, who desired to introduce amendments to limit the federal power, and to

crease that of the states and the people. Washington, Adams, Hamilton, and Jay were accounted among the federalists; while Jefferson, Madison, Gallatin, and Edward Livingston were among the leaders of the republicans. The federal party on the French question advocated a strict neutrality, while the republicans freely avowed their sympathy for France, and their willingness to aid the French republic in its struggle with the European monarchies. Party spirit ran high on this point, yet at the second presidential election in 1792 Washington again received the unanimous votes of the electoral colleges. Adams was elected vice-president, receiving 77 votes, while George Clinton, the republican candidate, received 50 votes. In April, 1793, Citizen Genet arrived in America as minister from the French republic, and made such efforts to involve the United States in war with Great Britain, that Washington at length demanded his recall of the French government, and another minister was sent in his place. Notwithstanding, however, the moderation of the executive, the party feeling on the French and English question was exceedingly violent among the people and in congress, where in both houses parties were nearly equally divided. The feeling against Great Britain was strongly stimulated by the obnoxious conduct of the British government in retaining possession of forts in the west to which their title had been ceded by the treaty of 1783, and in seizing American vessels and impressing American seamen. After in vain remonstrating against these outrages, the president, sincerely anxious to avoid war, sent John Jay as a special envoy to England, where, in Nov. 1794, a treaty was concluded, which was regarded by the republicans as so favorable to England that the requisite confirmation by the senate was obtained with difficulty, and its promulgation among the people raised an extraordinary clamor against Jay and the president, which however soon subsided. After a full discussion, in the course of which Fisher Ames made his celebrated speech on the British treaty, the house of representatives, in which there was a majority in opposition to the administration, passed the act for carrying the treaty into effect by a vote of 51 to 48. This settled the dispute with England, but the ratification of the treaty exasperated the French government, which openly showed its displeasure by decrees under which American commerce suffered continual annoyances and losses, and by insults to Mr. Pinckney, the American minister at Paris. Among the important domestic events of Washington's administration were the admission into the Union of the new states of Vermont (1791), Kentucky (1792), and Tennessee (1796), and the whiskey insurrection against an unpopular excise law, which in 1794 threw western Pennsylvania into confusion, but was energetically suppressed by the president, who called out 15,000 militia for the purpose. On

the approach of the third presidential election, Washington was earnestly pressed to become a candidate for another term, and would doubtless have been unanimously reelected; but he positively declined, and issued, in Sept. 1796, a "Farewell Address," in which he urged his countrymen to adhere to the principles upon which he had endeavored to conduct his administration, and upon which alone in his judgment could the liberty and happiness of the United States be firmly based. The universal veneration for Washington had in a measure curbed the manifestations of party spirit at the two elections in which he had been a candidate; but on his withdrawal from the canvass, the two great parties at once arrayed themselves against each other with a bitterness of zeal never since equalled. The federalists supported John Adams and the republicans Thomas Jefferson for president, and the result was that Adams, who received 71 electoral votes, was chosen president, while Jefferson, who received 68, the next highest number, became, by the requisitions of the constitution as it then was, the vice-president. The two next highest candidates were Thomas Pinckney and Aaron Burr. The new president selected as his cabinet Timothy Pickens, secretary of state; Oliver Wolcott, of the treasury; James McHenry, of war; and Charles Lee, attorney-general. In 1798 the navy department was created, and Benjamin Stoddart made secretary. The relations between France and the United States were of so threatening a character, that one of the first acts of President Adams was to convene congress in extra session, May 15, 1797. Three envoys, C. C. Pinckney, Elbridge Gerry, and John Marshall, were sent to France with authority to adjust all difficulties. The French government refused to receive them, but intimated that a considerable present of money would greatly facilitate negotiations, and that a refusal to pay the bribe would lead to war. "War be it, then," replied Pinckney; "millions for defence, but not a cent for tribute." Pinckney and Marshall, who were federalists, were ordered to quit France; but Gerry, who was a republican, was allowed to remain. The insult to their envoys excited great indignation in the United States, and congress made preparations for war. The army and navy were enlarged, and Washington was appointed commander-in-chief, with the rank of lieutenant-general. Hostilities actually began on the ocean, the U. S. frigate *Constellation* capturing a French frigate in the West Indies, and subsequently disabling another of superior force in an action lasting 5 hours. The decided measures adopted by the United States were not without effect on the French government, and overtures were made to the president for a renewal of negotiations. An embassy was sent, and Napoleon Bonaparte having attained to power, a treaty was promptly concluded, Sept. 30, 1800, and peace between the two countries

reestablished. During these troubles with France two acts were passed by congress, known as the alien and sedition laws, the first empowering the president to order aliens who were conspiring against the peace of the United States to quit the country, and the other restricting the liberty of speech and of the press. The alien law was defended on the ground that the country swarmed with French and English emissaries, whose mission was to embroil the United States with European quarrels; while the apology for the sedition law was the unquestionable licentiousness of the press, which at that time was chiefly conducted by refugees and adventurers from Great Britain and Ireland. Nevertheless these laws became exceedingly unpopular, and were bitterly denounced as harsh and unconstitutional. They contributed largely to the dissatisfaction with Mr. Adams's administration, which prevailed especially in the South and West, and which led in the next presidential election to the success of the republican candidates, Jefferson and Burr, each of whom received 73 votes, while Mr. Adams, who was a candidate for reelection, received but 65. The tie in the votes for Jefferson and Burr threw the election into the house of representatives, where on the 36th ballot Jefferson was chosen president and Burr vice-president. This contest led to an amendment of the constitution, by which, instead of the original article which required the electors of president and vice-president to vote for two persons for those offices, of whom the one who had the highest number of votes was to be president, an article was substituted requiring the electors to designate which person was voted for as president and which as vice-president. This amendment, which forms the 12th article of the amendments to the constitution, was announced by the secretary of state as adopted and ratified Sept. 25, 1804, it having been approved by all the states except Massachusetts, Connecticut, and Delaware. Very soon after his inauguration President Jefferson began to remove federalists from office and appoint democrats in their stead. He justified this policy on the ground that during the administration of Mr. Adams none but federalists had been appointed, and that it was not just that one party should have a majority of offices. Scarcely any vacancies existed except those created by removal; "those by death are few, by resignation none." The removals made by him for political reasons, however, were very few compared to the wholesale changes which afterward came to be the practice. His cabinet consisted of James Madison, secretary of state; Henry Dearborn, of war; Albert Gallatin, of the treasury; Robert Smith, of the navy; and Levi Lincoln, attorney-general. For the most part his administration was marked by vigor and enlightened views, and he was reelected for a second term with little opposition, his competitor, C. C. Pinckney of South Carolina, receiving

only 14 votes. During his first term Ohio was admitted (1802), and Louisiana was purchased of France in 1803, and two territories formed of it, called the territory of Orleans and the district of Louisiana. The insolence of the piratical states on the Barbary coast was humbled by the bombardment of Tripoli in 1804, and by the invasion of that state by a sea force led from Egypt by Capt. Eaton, an American officer, which led to a satisfactory treaty in 1805. Mr. Jefferson's second term began March 4, 1805. In the following year Aaron Burr, who had been succeeded as vice-president by George Clinton, secretly organized chiefly in the western states, a military expedition which excited the suspicion of the government, and led to his arrest and trial at Richmond in 1807 on a charge of attempting to dismember the Union and to establish an independent dominion west of the Alleghenies; but no overt act being proved against him, he was acquitted by the jury. The amicable relations which had existed between the United States and Great Britain for several years began in 1806 to be disturbed by the injuries inflicted on American commerce through the operation of an order in council of the British government declaring the whole coast of Europe, from the Elbe to Brest, to be in a state of blockade; an order which Napoleon retaliated by declaring in a decree issued at Berlin, Nov. 21, 1806, a blockade of all the ports of the British islands. Another order of the British government, Jan. 7, 1807, prohibited all coast trade with France. Under these orders and decrees great numbers of American vessels were seized by French and English cruisers, and our foreign commerce, which had attained extraordinary prosperity from the neutral position of the country, was nearly destroyed. The irritation against Great Britain produced by her depredations on our commerce was greatly increased by her persistent assertion of the right to search American vessels for suspected deserters from her navy, a right continually exercised by her cruisers in the most offensive manner, and in the practice of which multitudes of native-born American seamen were forced into the British navy. The insolence of the British naval officers was at length carried so far that in June, 1807, the U. S. frigate *Chesapeake* was stopped near the entrance to Chesapeake bay by the English man-of-war *Leopard*, and on the refusal of her commander to submit to a search was fired into, and 21 of her crew killed or wounded. Four alleged deserters were then taken from her, three of whom proved on investigation to be native Americans. This outrage, for which immediate reparation was demanded by the president, was not atoned for till 4 years later, and even then the right of search was still claimed by the British government, and eventually became a cause of war. Another order in council was issued Nov. 11, 1807, forbidding neutral vessels to enter French ports until they had previously stopped at a British

port and paid a duty. This was answered in December of the same year by Napoleon's Milan decree, confiscating every vessel which would submit to British search or pay any duties whatever to Great Britain. In the same month congress, on the recommendation of the president, laid an embargo, which detained all vessels, foreign or American, in our ports, and ordered all American vessels to return immediately home. This measure was vehemently denounced by the federal party, and for a time it prostrated the shipping and commercial interests of the United States. It was repealed in Feb. 1809, just before the expiration of the president's second term. Although solicited by addresses from the legislatures of several states to serve a third term, Mr. Jefferson declined, and the republican, or, as it was now often called, the democratic party, supported James Madison for president, and George Clinton for vice-president. Madison and Clinton were elected, the former receiving 122 votes and the latter 113, while the federal candidates, C. C. Pinckney and Rufus King, received each 47. The states which supported the federal candidates were New Hampshire, Massachusetts, Rhode Island, Connecticut, and Delaware; and two districts in Maryland and three in North Carolina also chose federal electors. The ruinous operation of the embargo law had considerably weakened the democratic party, particularly in the commercial middle and eastern states, and Mr. Jefferson went out of office warmly denounced by one portion of the people, and as warmly praised by another and more numerous party. His friends on the one hand claimed that his administration had accomplished for the nation the acquisition of Louisiana with more than 1,000,000 square miles of territory, and the free navigation of the Mississippi, which also settled a troublesome controversy with Spain, and removed the dangerous neighborhood of France; and that it had upheld the dignity of the republic in its controversies with England, and had compelled the Barbary powers to respect the flag of the United States. The position of the opponents of Mr. Jefferson at the same time is given in the following picture of the state of the country, drawn by a committee of the Massachusetts legislature in Jan. 1809: "Our agriculture is discouraged; the fisheries abandoned; navigation forbidden; our commerce at home restrained if not annihilated; commerce abroad cut off; our navy sold, dismantled, or degraded to the service of cutters or gunboats; the revenue extinguished; the course of justice interrupted; and the nation weakened by internal animosities and divisions at the moment when it is unnecessarily and im providently exposed to war with Great Britain, France, and Spain." Mr. Madison formed his cabinet as follows: Robert Smith, secretary of state; William Eustis, secretary of war; Paul Hamilton, secretary of the navy; Albert Gallatin, secretary of the treasury; and Caesar

A. Rodney, attorney-general. Congress met in May, 1809, in extra session, and continued with some modifications the non-intercourse act with Great Britain and France, which was again modified about a year later. A long negotiation was carried on with the English government on the subject of this act, the orders in council, and the right of search, which resulted only in augmenting the unfriendly feeling between the two countries. The British government adhered tenaciously to its policy relating to neutrals, and American vessels and their cargoes continued to be seized by British cruisers and condemned in British admiralty courts. No alternative was left to the United States but war; and though the president was exceedingly averse to forcible measures, the pressure of public opinion, and the influence of Clay, Calhoun, Lowndes, and other leaders of the war party, at length induced him to acquiesce reluctantly in a declaration of hostilities. He sent to congress, June 1, 1812, a message on the subject of the aggressions of Great Britain, which was referred to the committee on foreign relations in the house of representatives, who on June 8 reported a manifesto as the basis of a declaration of war, for these reasons: the impressment of American seamen by the commanders of British ships of war; the British doctrine and system of blockade; the orders in council; and, lastly, various depredations committed by English subjects on the commerce of the United States. The house adopted the measure by a vote of 79 to 49, and the senate by a vote of 19 to 13; and on June 18 the president signed the act declaring war. Five days later the British government revoked its orders in council, a step which, if taken a little earlier, would have doubtless prevented the outbreak of hostilities. Great Britain was at this time engaged in her tremendous struggle with Napoleon, and gave not much thought or effort to affairs on this side of the Atlantic. For several months after the declaration of war the British government did little toward counter hostilities. The blockade of the Chesapeake and the Delaware was not proclaimed till Dec. 26, 1812, and British naval forces did not appear on the American coasts in any formidable power till Feb. 1813. On March 20, 1813, the whole coast of the United States was declared to be in a state of blockade, with the exception of the coasts of the federal states of New England, a distinction obviously made with the view of widening the dissension between the federal and democratic parties. But although the United States had the advantage that the main force of their enemy was occupied by the great European conflict, their own preparation for the contest was in every respect inadequate. The treasury was almost empty, the revenue having been nearly ruined by the non-importation acts and embargoes; the army numbered but 10,000 men, one half of them raw recruits, and was very deficient in officers of experience; while the navy comprised only 8 frigates, 2

sloops, and 5 brigs. Congress, however, authorized the president to enlist 25,000 regulars and 50,000 volunteers. Henry Dearborn, who had served with credit in the war of the revolution, was appointed major-general and commander-in-chief, and James Wilkinson, Wade Hampton, William Hull, and Joseph Bloomfield were appointed brigadiers. Long before war was declared British emissaries had been engaged in exciting the north-western Indians against the Americans; and in the summer of 1811 hostilities were actually commenced by the tribes north of the Ohio under the lead of Tecumseh, a Shawnee chief of great ability. William Henry Harrison, governor of Indiana territory, encountered them with a considerable force on the banks of the Tippecanoe river, Nov. 7, 1811, and defeated them in one of the most hotly contested battles ever fought between the Indians and the whites. The tribes however were not subdued, and when war was declared in 1812 Gen. Hull, then governor of Michigan, was marching against them at the head of 2,000 men. He was ordered instead to invade Canada from Detroit, which he accordingly did with a force wholly inadequate to the enterprise. He was soon compelled to fall back, and his force being reduced by various casualties to 800 men, he was compelled on Aug. 16 to surrender his army, Detroit, and all Michigan to Gen. Brock. An invasion of Canada on the Niagara frontier was almost equally unsuccessful, and the campaign of 1812 closed with little or no credit to the American arms on land. On the ocean, however, the navy, small as it was, had achieved a series of brilliant victories. The frigate *Constitution*, Capt. Isaac Hull, captured the British frigate *Guerriere*, Aug. 19; the sloop of war *Wasp*, Capt. Jones, captured the brig *Frolic*, Oct. 18; the frigate *United States*, Capt. Decatur, captured the frigate *Macedonian*, Oct. 25; and the *Constitution*, of which Capt. Bainbridge had now taken command, captured the frigate *Java*, Dec. 29. In all these contests the British loss in killed and wounded was almost 8 to 1 of that of the Americans, and the result highly elated the public, with whom the navy hitherto had been in no special favor. A vast swarm of privateers scoured the ocean, preying upon British commerce to such an extent that their captures in this year alone amounted to more than 800 vessels. For the campaign of 1813 three armies were raised, viz.: that of the west, at the head of Lake Erie, under Gen. Harrison; that of the centre, between Lakes Erie and Ontario, under Gen. Dearborn; and that of the north, near Lake Champlain, under Gen. Wade Hampton. Their operations were productive of alternate successes and reverses. In January a detachment of 800 from the western army, under Gen. Winchester, was defeated and captured at the river Raisin, and most of the prisoners massacred by the Indian allies of the English. In April Gen. Pike with 1,700 Americans captured York (now Toronto), but

was himself killed by the explosion of a mine prepared for the purpose; the British loss was about 700. About the same time Col. Duff with 800 men was defeated by the Indians under Tecumseh, with heavy loss. In May an attack on Sackett's Harbor by the British under Gen. Prevost was repulsed by Gen. Brown, and Fort George in Canada taken by the Americans under Gen. Boyd and Col. Miller. In this last affair the British lost nearly 1,000 men. In October Gen. Harrison defeated the British near the Thames river in Canada, with severe loss, the Indian chief Tecumseh being among the slain. On the Niagara frontier, where the chief preparations for the invasion of Canada had been made, a disagreement between Gens. Wilkinson and Hampton prevented any efficient action by the American forces. The navy as usual was more successful than the army. On Lake Erie, Sept. 10, a British fleet of 6 vessels was captured after a severe contest by Commodore O. H. Perry, an achievement which rendered the Americans masters of the lake. On the ocean, the *Hornet*, Capt. Lawrence, captured the *Peacock*, Feb. 24; and the *Enterprise*, Lieutenant Burrows, captured the *Boxer*, Sept. 5. On the other hand, the U. S. frigate *Chesapeake*, commanded by Capt. Lawrence, was on June 1 captured by the British frigate *Shannon*, Capt. Broke, an exploit for which the tower guns at London were fired and Capt. Broke was knighted. The campaign of 1814 was conducted with more vigor on both sides, and was marked by obstinate and sanguinary engagements on the Niagara frontier. On July 5 the British were defeated at Chippewa by Gen. Brown, and on the 25th at Bridgewater or Lundy's Lane by Gens. Brown and Winfield Scott, the latter of whom had also distinguished himself at Chippewa. The war in Europe having closed, large reinforcements, consisting of the troops which had served under Wellington in Spain, were sent to Canada by the British government; and Sir George Prevost, at the head of 14,000 men, invaded New York on the northern frontier and laid siege to Plattsburg. His army was supported by a powerful fleet on Lake Champlain, commanded by Commodore Downie. On Sept. 11 the U. S. fleet, commanded by Commodore Macdonough, totally defeated the English fleet, and on the same day Gen. Macomb repulsed the British army, which fled back to Canada with a loss of 2,500 men. In August a British fleet arrived in the Chesapeake with an army of 5,000 men commanded by Gen. Ross, who landed in the Patuxent and marched on Washington, and, after encountering and putting to flight the militia at Bladensburg, took possession of the federal city and burned the capital, the president's house, and other public buildings. On the day after this barbarous exploit the British retired to their ships, and on Sept. 12-18 made an attack on Baltimore, where they were repulsed by the citizens, and Gen. Ross was killed. On the ocean during this year the

British vessels of war *Epervier*, *Avon*, *Rein-leer*, *Oyana*, *Levant*, and *Penguin* were taken by the Americans, who on their part lost the frigates *Essex* and *President*, both captured by greatly superior forces of the enemy. The restoration of peace in Europe led both the United States and Great Britain to desire a termination of their contest, which had in fact grown wholly out of disputes originating in the great conflict of arms beyond the Atlantic; and after protracted negotiations a treaty of peace was finally signed at Ghent, Dec. 24, 1814, on the part of the United States, by Henry Clay, John Quincy Adams, Jonathan Russell, James A. Bayard, and Albert Gallatin. The treaty provided for the mutual restoration of all territory taken during the war, and for the mutual appointment of commissioners to determine the northern boundary of the United States. Nothing was said of the impressment of American seamen, one of the main causes of the war, but the practice was discontinued by the British naval commanders. Before the news of peace could cross the Atlantic a British army 12,000 strong, led by Gens. Pakenham, Gibbs, Keene, and Lambert, landed on the coast of Louisiana and made an attack on New Orleans, which was defended by Gen. Andrew Jackson with 5,000 men, chiefly militia from Tennessee and Kentucky. The attack was repelled, Jan. 8, 1815, with a loss to the British of 2,000 killed, wounded, and prisoners, while the entire American loss was but 71. The war from its beginning had been distasteful to the majority of the people of New England, who, being mostly federalists, regarded it not only as unnecessary and impolitic, but as waged chiefly to gratify democratic prejudice against England and partiality for France. They suffered from it immense losses by the destruction of their commerce and their fisheries, and the federal government did little or nothing for their protection from the enemy. It was to remedy these evils that the celebrated Hartford convention was held (see *HARTFORD CONVENTION*), which resulted in nothing but a report to the legislatures which it represented, urging certain amendments to the constitution and a definition of the power of the federal government over state troops. This last point was almost immediately settled by congress in a satisfactory manner, and the news of the treaty of Ghent put an effective stop to the discussions raised by the convention. For many years, however, the democrats continued to impute treasonable designs to the Hartford convention, and it was one of the causes which led to the decay and extinction of the federal party. During the war the Algerines had resumed their old practice of piracy, had seized several American vessels, and had insulted and plundered the American consul. Immediately after the conclusion of peace with Great Britain, a naval force commanded by Decatur and Bainbridge was sent to the Mediterranean, which captured several Algerine cruisers, and in a few

weeks compelled the rulers of Algiers, Tunis, and Tripoli to make indemnity for their outrages, and to agree to abstain from further depredations on American commerce. The national finances were in a very confused state at the close of the war, the debt created by which exceeded \$80,000,000. The banks, except in New England, had suspended specie payments, and the want of a uniform and solvent currency was urgently felt. To remedy this latter evil, congress in the session of 1816-'17 chartered for 20 years a national bank at Philadelphia, with a capital of \$35,000,000, whose notes furnished a convenient and uniform circulating medium, convertible at all times into gold and silver.—The presidential election of 1812 had resulted in the choice of Mr. Madison for a second term by a vote of 128, against 89 for De Witt Clinton, who was supported by the federalists. At the same time Elbridge Gerry was chosen vice-president in opposition to Jared Ingersoll. On the approach of the presidential election of 1816 it was understood that Mr. Madison would not be a candidate for reelection, and a caucus of the democratic members of congress was held to nominate a successor. A portion of the party opposed to the predominance of Virginia in the government, that state having given presidents to the country for 6 out of 7 of the presidential terms since the adoption of the constitution, supported William H. Crawford of Georgia in the caucus; but James Monroe of Virginia, Mr. Madison's secretary of state, received the nomination, and in the election was chosen by 183 votes, against 84 votes given to Rufus King by the federal states of Massachusetts, Connecticut, and Delaware. Daniel D. Tompkins of New York was elected vice-president. The administration of Mr. Madison terminated March 4, 1817. The war with Great Britain was its principal feature, but among other events of importance were the admission of Louisiana into the Union in 1812, and of Indiana in 1816, and the establishment of the American colonization society in 1817. President Monroe's cabinet was constituted as follows: J. Q. Adams, secretary of state; William H. Crawford, of the treasury; John C. Calhoun, of war; Benjamin W. Crowninshield, of the navy; and William Wirt, attorney-general. His administration commenced under very favorable circumstances. Party distinctions had so nearly disappeared, that democrats and federalists combined to support the government; and during an extensive tour which the president made through the eastern and middle states soon after his inauguration, he was everywhere favorably received by the people, among whom his appearance and demeanor rendered him popular; and finally on the expiration of his term he was reelected in 1820 by all the electoral votes except one. The main event of his administration was the Missouri controversy, by which for the first time the country was divided upon the slavery question, and the states of the North,

in which slavery, never very deeply rooted, was extinct or in process of extinction, were arrayed against the states of the South. The admissions to the Union hitherto had been of a slaveholding and non-slaveholding state alternately. Vermont and Kentucky, Tennessee and Ohio, Louisiana and Indiana had mutually offset each other; and in 1817 the slaveholding state of Mississippi was admitted, followed immediately in 1818 by non-slaveholding Illinois. Congress in its session of 1818-'19 authorized the territory of Alabama, which was rapidly filling with a slaveholding population, to form a constitution without any prohibition of slavery. A similar bill was brought forward for the territory of Missouri, and James Tallmadge of New York moved in the house of representatives to insert a clause prohibiting any further introduction of slaves, and granting freedom to the children of those already there on their attaining the age of 25; and this motion was carried, 87 to 76. A few days later John W. Taylor of New York moved as an amendment to a bill for the organization of Arkansas, that slavery should not hereafter be introduced into any part of the territories of the United States N. of lat. 36° 30'. This was intended as a compromise, but was warmly opposed, a large number both of northern and southern members declaring themselves hostile to any compromise whatever, and the amendment was consequently withdrawn by Mr. Taylor. The slaveholders contended that for congress to prohibit slavery in the territories would be a violation of the constitutional right of the citizen to enjoy his property anywhere within the jurisdiction of the United States. The restrictionists, on the other hand, denied that men could be property under the jurisdiction of the United States, however the case might be under the laws of particular states; and they maintained that the constitutional question was conclusively settled by the action of the congress contemporaneous with the framing of the federal constitution, which in 1787 introduced into the bill for the government of the territory N. W. of the Ohio the proviso that "there shall be neither slavery nor involuntary servitude in said territory, otherwise than in punishment for crime." And in further confirmation of their views, they brought forward the fact that the most distinguished statesman of the South, Thomas Jefferson, had in 1784 introduced and urged with all his influence the passing of a bill in congress prohibiting slavery, not only in all the territory held by the United States, but in all that might be afterward acquired. The debate on this subject was long and excited. The southern orators declared that if the restriction should be persisted in the South would retire and the Union be dissolved. Mr. Cobb of Georgia, looking significantly at Mr. Tallmadge, exclaimed that "a fire had been kindled which all the waters of the ocean could not put out, and which only seas of blood could extinguish." Mr. Tallmadge replied with equal

warmth: "If a dissolution of the Union were to take place, let it be so! If civil war, with gentlemen so much threaten, must come, let me only say, let it come! My hold on life is probably as frail as that of any man who now hears me; but while that hold lasts, it shall be devoted to the freedom of man. If blood is necessary to extinguish any fire which I have assisted to kindle, while I regret the necessity, shall not hesitate to contribute my own." The senate refused to concur in the restriction imposed by the house, and consequently the Missouri bill failed for the session of 1818-'19. During the recess of congress a strong public agitation against slavery arose in the middle states, and finally spread to New England, both democrats and federalists cooperating in it. An accidental advantage in the controversy, however, was furnished to the South by the erection of Maine into a state with the consent of Massachusetts, thus adding another to the list of free states, and forming a counterpoise to Alabama, which was admitted into the Union early in the session of 1819-'20, an event promptly followed by the admission of Maine. When the legislatures of the free states met in their annual session in 1820, the agitation among the people on the slavery question was forcibly expressed by their representatives. Pennsylvania led off by a solemn appeal to the states "to refuse to covenant with crime," and by a unanimous declaration that it was the right and the duty of congress to prohibit slavery in the territories. The rest of the middle states also unanimously adopted similar resolutions. Ohio and Indiana took the same position; and though the New England legislatures were silent, numerous memorials from towns, cities, and public meetings in favor of freedom were laid before congress. The legislatures of the slave states expressed themselves, on the other hand, very strongly in opposition to restriction. In congress the debate was long and acrimonious. The senate sent to the house the Missouri bill with the prohibition of slavery in that state struck out, but with the proviso that it should not hereafter be tolerated N. of lat. 36° 30'. The striking out of the restrictive clause was reluctantly assented to by the house by a vote of 90 to 87, a very few northern members voting for it. The compromise by which slavery was prohibited for ever N. of 36° 30' was then agreed to by a vote of 184 to 43. The northern states acquiesced in this compromise as a political necessity, and as finally settling a controversy dangerous to the peace and stability of the Union, and the slavery agitation subsided for a time. The other great question of Mr. Monroe's administration was the recognition of the Spanish American republics, which had declared and maintained their independence for several years. Chiefly by the efforts and the eloquence of Henry Clay, their independence was acknowledged in 1822; and in the following year the president in his annual message declared that "as a principle the American

continents, by the free and independent position which they have assumed and maintained, are henceforth not to be considered as subjects for future colonization by any European power;" a declaration which has since been famous as the "Monroe doctrine."—Mr. Monroe declined being a candidate for a third term, and in the presidential election of 1824 the confused state of parties led to the nomination of four candidates, none of whom had a majority of the electoral votes. Andrew Jackson received 99, John Quincy Adams 84, William H. Crawford 41, and Henry Clay 37. The election went to the house of representatives, where Mr. Adams received the vote of 18 states, and was declared president. John C. Calhoun had been elected vice-president by the electoral colleges. The political views of Mr. Adams did not differ from those of Mr. Monroe, and his foreign and domestic policy was very similar. He appointed Henry Clay secretary of state; Richard Rush, of the treasury; James Barbour, of war; Samuel L. Southard, of the navy; and William Wirt, attorney-general. His administration was remarkable for order, method, and economy, though party spirit, springing from quarrels generated by the election, was higher and more rancorous than it had been for many years. Perhaps the most important event in his term was the adoption of what was called the American system of protecting home manufactures by a heavy duty upon foreign articles of the same kind, a system popular in the manufacturing North, but bitterly opposed in portions of the agricultural South. A tariff law enacted in 1828 on the principle of protection, led a few years later to political complications of a most serious character. The presidential contest of the same year was carried on with great animation and virulence, chiefly by means of discussions on the personal character and history of the candidates, Gen. Jackson having been nominated in opposition to Mr. Adams. The result was the election of Jackson by 178 votes to 83 for Adams, while John C. Calhoun was re-elected vice-president in opposition to Richard Rush, who was supported by the friends of Mr. Adams. President Jackson selected for his cabinet Martin Van Buren, secretary of state; Samuel D. Ingham, of the treasury; John H. Eaton, of war; John Branch, of the navy; John McPherson Berrien, attorney-general; and William T. Barry, postmaster-general. The last named officer was now for the first time made a member of the cabinet. In his first annual message, Dec. 1829, the president took strong ground against the renewal of the charter of the United States bank, as an institution not authorized by the constitution. A long and excited contest ensued in congress and among the people on this question, between the friends of the bank and the partisans of the president. Congress in 1832 passed a bill to recharter the bank, but Jackson vetoed it; and as it failed to receive the votes of two thirds of the members of both houses, the bank

charter expired by limitation in 1836. The commercial part of the community in this contest generally took the side of the bank, and the party formed in opposition to the president assumed the name of whig, while his supporters adhered to the old name of democracy. The tariff of 1828 had always been distasteful to the cotton-growing states, and on the passing of an act of congress in the spring of 1832 imposing additional duties upon foreign goods, the discontent of South Carolina broke out in almost actual rebellion. A state convention held there in November declared the tariff acts unconstitutional and therefore null and void, and proclaimed that any attempt by the general government to collect duties in the port of Charleston would be resisted by force of arms, and would produce the secession of South Carolina from the Union. The chief leaders of the nullifiers, as this South Carolina party was called, from their assertion of the right of a state to nullify an act of congress which she deemed unconstitutional, were John C. Calhoun, who had recently resigned the vice-presidency and become a senator of the United States; Robert Y. Hayne, also a senator; and George McDuffie, governor of the state. To support their position they made considerable military preparations, and for a time civil war between South Carolina and the federal government seemed inevitable. In this crisis Jackson (who had just been reelected for a second term by 219 electoral votes, against a divided opposition which cast 49 votes for Henry Clay, 11 for John Floyd, and 7 for William Wirt, Mr. Van Buren being at the same time chosen vice-president) acted with the promptness and energy which always marked his career. All the disposable army was ordered to assemble at Charleston under Gen. Scott, and a ship of war was sent to that port to insure the collection of duties. A proclamation was issued, Dec. 10, 1832, denying the right of a state to nullify any act of the federal government, and warning all engaged in fomenting the rebellion that the laws against treason would be enforced at all hazards and to their utmost penalties. The leaders of the nullifiers were also privately given to understand that if they committed any overt act they should surely be hanged. The firmness of the president, who in this conjuncture was warmly supported by the great mass of the nation of all parties, gave an effectual check to the incipient rebellion, and the affair was finally settled by a proposition brought forward in congress by Henry Clay, the leading champion of the protective system, for the modification of the tariff by a gradual reduction of the obnoxious duties—a compromise which was accepted by the nullifiers as the only means of escape from the perilous position in which they had placed themselves. Meanwhile a personal quarrel had led to changes in the cabinet, which in the latter part of 1831 was constituted thus: Edward Livingston, secretary of state; Louis McLane,

of the treasury; Lewis Cass, of war; Levi Woodbury, of the navy; and Roger B. Taney, attorney-general. In his annual message in Dec. 1832, the president recommended the removal of the public funds from the bank of the United States, where they were by law deposited. Congress by a decisive vote refused to authorize the removal, and the president on his own responsibility directed the secretary of the treasury to withdraw the deposits and place them in certain state banks. Mr. McLane declined to do so without better reasons than were apparent, and was transferred to the state department, which had become vacant by the appointment of Mr. Livingston as minister to France. William J. Duane, who succeeded Mr. McLane in the treasury department, was as unmanageable as his predecessor, and was finally removed, and Roger B. Taney, the attorney-general, appointed in his place, Benjamin F. Butler succeeding to the attorney-generalship. Mr. Taney at once removed the deposits to the local banks selected as agents of the government. This and other steps indicating a settled hostility to the bank were attended by a financial panic, and great commercial distress immediately ensued. Intense excitement prevailed throughout the country, and considerable numbers who had hitherto supported Jackson in all his measures went over to his opponents. The opposition in the senate, headed by Clay, Webster, and Calhoun, denounced him with great power and severity, and a resolution censuring his policy was adopted by a vote of 26 to 20. This was expunged from the journal, March 28, 1837, on motion of Mr. Benton, by a vote of 24 to 19. The house of representatives, however, sustained the president. The foreign diplomacy of President Jackson was very successful. Useful commercial treaties were made with several countries, and indemnities for spoiliations on American commerce were obtained from France, Spain, Naples, and Portugal. At home the principal events of his administration, beside those already mentioned, were the extinction of the national debt, the beginning of the war with the Seminole Indians in Florida, and the admission of Michigan and Arkansas into the Union in 1836. At the end of his second term, March 4, 1837, Jackson retired from public life with a reputation, which, at first confined to his own party, has gradually become universal, inferior to that of no American president for energy, patriotism, and practical sagacity.—In the presidential contest of 1836 Mr. Van Buren was supported by the democrats, while the opposition or whig vote was divided between William Henry Harrison, Judge White, Daniel Webster, and Willie P. Mangum, the greater part of it being given to Gen. Harrison. The result was the election of Mr. Van Buren by 170 electoral votes, against 124 for all the other candidates. Richard M. Johnson was elected vice-president by the senate, in opposition to Francis Granger, John Tyler, and Wil-

liam Smith. President Van Buren selected as his cabinet, John Forsyth, secretary of state; Levi Woodbury, of the treasury; Joel R. Poinsett, of war; Mahlon Dickerson, of the navy; R. F. Butler, attorney-general; and Amos Kendall, postmaster-general; all of whom except Mr. Poinsett had been members of President Jackson's cabinet at the close of his last term. The new administration commenced under most untoward circumstances, the business of the country, affected by excessive speculation and overtrading, and by sudden contractions and expansions of the currency, being on the verge of almost utter ruin. Within two months after the inauguration of the president the mercantile failures in the city of New York alone amounted to more than \$100,000,000. Nearly the whole of Mr. Van Buren's term was occupied by attempts to remedy these evils by legislative measures for the establishment of a stable currency, and a sound system of government finance. A favorite measure of the president was the independent treasury system for the custody of the public funds, which ultimately was sanctioned by congress, and is still in force. The war with the Seminoles was continued through the whole of Mr. Van Buren's term, and in fact was not ended till 1842, after it had cost the United States nearly \$40,000,000. In June, 1838, Mr. Dickerson resigned the secretaryship of the navy, and James K. Paulding was appointed in his place. In the same year B. F. Butler resigned as attorney-general, and Felix Grundy was appointed, who in the following year was succeeded by Henry D. Gilpin. John M. Niles succeeded Amos Kendall as postmaster-general in May, 1840. The pecuniary troubles of the country were imputed in great measure to the financial policy of the administration by its political opponents; and as the presidential election of 1840 approached, the state elections indicated that Mr. Van Buren had not inherited all the popularity of his immediate predecessor, and that the power of the democratic party was in imminent danger of at least a temporary overthrow. A whig national convention (the congressional caucus system for nominating candidates having been abandoned) was held at Harrisburg, Dec. 4, 1839, and after several ballots Gen. Harrison was nominated as a candidate for president, with John Tyler for vice-president. The national democratic convention met at Baltimore, May 5, 1840, and unanimously nominated Mr. Van Buren. The canvass was one of the most animated and exciting that has ever taken place, and the result was that Harrison and Tyler each received 234 electoral votes, and Van Buren 60, while the same number were divided between R. M. Johnson, L. W. Tazewell, and James K. Polk as democratic candidates for the vice-presidency.—Gen. Harrison was inaugurated March 4, 1841, and selected as his cabinet Daniel Webster, secretary of state; Thomas Ewing, of the treasury; John Bell, of war; George E. Badger, of the navy;

Francis Granger, postmaster-general; and J. J. Crittenden, attorney-general. Before, however, any distinctive line of policy could be adopted by the new administration, the president died, April 4, just one month after his inauguration. The presidential office devolved on John Tyler, who retained the cabinet of his predecessor until the following September, when all but the secretary of state resigned in consequence of the unexpected development of policy on the part of the president in relation to a national bank much more in accordance with the views of the democratic party, to which he had formerly been attached, than to those of the whigs, by whom he had been elevated to power. He repeatedly vetoed acts of congress chartering a national bank or fiscal agent, and was consequently vehemently denounced by the whigs as having betrayed the trust they had put in him. The places or the retiring members of the cabinet were filled by Walter Forward, appointed secretary of the treasury; John C. Spencer, of war; Abel P. Upshur, of the navy; Charles A. Wickliffe, postmaster-general; and Hugh S. Legaré, attorney-general. Mr. Webster continued to hold the office of secretary of state for the purpose of conducting negotiations with Great Britain on the subject of the north-western boundary, which was finally settled by a treaty concluded between him and Lord Ashburton, and ratified by the senate Aug. 20, 1842. In May, 1843, Mr. Webster resigned, and Mr. Legaré, the attorney-general, was made acting secretary of state, but died in the following June. Mr. Upshur was then transferred from the navy department to that of state, and Mr. Thomas W. Gilmer was made secretary of the navy; but both those gentlemen were killed, Feb. 28, 1844, by the bursting of a gun on board the U. S. war steamer Princeton, and John C. Calhoun was made secretary of state, and John Y. Mason of the navy. On April 12, 1844, a treaty to annex Texas to the United States was concluded by Mr. Calhoun and the agents of the new republic, but was rejected by the senate, on the ground that it would involve the country in a war with Mexico. The Texas question, however, immediately became the prominent issue in the presidential contest of that year, the democratic party supporting and the whigs opposing annexation. At the South it was advocated as a means of strengthening the slavery interest, and at the North it was in great part opposed for the same reason, the anti-slavery element in both the parties being at this period of considerable strength. The friends of Texas soon obtained control of the democratic party, and at the national convention of that party at Baltimore, May 27, 1844, Mr. Van Buren, who had expressed himself unconditionally opposed to annexation, was rejected as a candidate for the presidency, and James K. Polk, formerly governor of Tennessee and speaker of the U. S. house of representatives, was nominated, with George M. Dal-

las as candidate for vice-president. The whig national convention, which met at Baltimore, May 1, had already nominated for president Henry Clay, and for vice-president Theodore Frelinghuysen. The result of the election was 170 electoral votes for Polk and Dallas, and 105 for the whig candidates. The management of the Texas question was now assumed by congress, and joint resolutions for annexing that country to the United States as one of the states of the Union passed the house of representatives Jan. 25, 1845, by a vote of 120 to 98, and the senate March 1, by a vote of 27 to 25. They were immediately signed by President Tyler, whose last important official act was to sign two days later the bill admitting Florida and Iowa into the Union.—President Polk appointed as his cabinet James Buchanan, secretary of state; Robert J. Walker, of the treasury; William L. Marcy, of war; George Bancroft, of the navy; Cave Johnson, postmaster-general; and John Y. Mason, attorney-general. At the beginning of his administration the president found the country involved in disputes with Mexico, growing out of the annexation of Texas to the United States. Gen. Zachary Taylor was sent with a small army to occupy the region between the Nueces and the Rio Grande, which the United States claimed as belonging to Texas, while the Mexicans maintained that Texas had never extended beyond the Nueces. In April, 1846, a slight collision occurred on the Rio Grande between Gen. Taylor's army and that of the Mexican commander, Gen. Arista. When the news reached Washington, the president, on May 11, sent a special message to congress declaring that "war existed by the act of Mexico," and asking for men and money to carry it on. Congress, by a vote of 142 to 14 in the house, and of 40 to 2 in the senate, promptly appropriated \$10,000,000, and gave authority to call out 50,000 volunteers. Taylor meanwhile had defeated the Mexicans at Palo Alto, May 8, and at Resaca de la Palma, May 9, and subsequently on being reinforced continued the war by brilliant victories at Monterey in September, and at Buena Vista, Feb. 22, 1847. (See TAYLOR, ZACHARY.) The conduct of the war, which had so far been intrusted to Gen. Taylor, was now assumed by Gen. Scott, commanding in chief. The American forces, naval and military, were concentrated in the gulf of Mexico, and on March 9, 1847, Scott landed near Vera Cruz with about 12,000 men. That city was immediately besieged, and surrendered March 29. Gen. Scott soon began his march toward the city of Mexico, which he entered triumphantly Sept. 14, after a series of hard-fought and uniformly successful battles. (See SCOTT, WINFIELD.) Meanwhile Gen. Stephen W. Kearny, at the head of a small force, had marched from Fort Leavenworth over the great plains to Santa Fé, and conquered New Mexico in Aug. 1846. He instituted an American government over the province, and then resumed his march toward California, which

however had already been conquered by Col. Fremont and Commodore Stockton. On his arrival at Monterey, Gen. Kearny assumed the office of governor, and on Feb. 8, 1847, proclaimed the annexation of California to the United States. While Kearny was on his way to California, Col. Doniphan, at the head of 1,000 Missouri volunteers, had performed a prodigious march across the plains, and taken the city of Chihuahua, after routing, Feb. 28, 4,000 Mexicans, who met him about 18 miles from the city. Gen. Scott's army occupied the Mexican capital until after the ratification of a treaty of peace which was negotiated at Guadalupe Hidalgo, Feb. 2, 1848, by Nicholas P. Trist on the part of the United States. By this treaty Mexico granted to the United States the line of the Rio Grande as a boundary, and also ceded New Mexico and California. On their part the United States agreed to pay Mexico \$15,000,000, and to assume the debts due by Mexico to American citizens to an extent not exceeding \$8,750,000. At the beginning of the Mexican war negotiations were going on between Great Britain and the United States in relation to Oregon, which the latter had long considered as one of their territories. "The whole of Oregon up to 54° 40'" had been one of the watchwords of the democratic party during the recent presidential canvass, and Mr. Polk in his inaugural address had declared that "our title to the country of the Oregon was clear and unquestionable." Great Britain, however, on various pretexts, asserted a claim to the whole country, and the president after much negotiation finally offered as an amicable compromise the boundary of the parallel of 49°, with a modification which gave to her the whole of Vancouver island, which was agreed to by Great Britain. The other important measures of Mr. Polk's administration were the modification of the tariff in 1846, by which its protective features were lessened, and the admission of Wisconsin into the Union as the 30th state, May 29, 1848.—Mr. Polk, in accepting the democratic nomination in 1844, had pledged himself not to be a candidate for reelection; and in the democratic national convention which met at Baltimore in May, 1848, Lewis Cass was nominated for president, and William O. Butler for vice-president. By the whig convention, which met at Philadelphia on June 1, Zachary Taylor and Millard Fillmore were nominated for the same offices. The question of slavery had a powerful influence on the political combinations of this period. After the subsidence of the Missouri agitation in 1821, slavery attracted little attention until the establishment of the "Liberator" newspaper by William Lloyd Garrison at Boston, Jan. 1, 1831, and the formation of anti-slavery societies in the free states in 1832-'3 by Arthur Tappan and others. These societies relied exclusively on moral and religious influences to promote emancipation, and avoided political action, affirming that congress had no right to interfere with slavery in the states, though they

petitioned that body to abolish the institution in the territories, in the District of Columbia, and wherever else the federal government had constitutional jurisdiction. They declared that their principles led them "to reject, and to treat the oppressed to reject, the use of all carnal weapons for deliverance from bondage." Their lecturers, newspapers, public meetings, and petitions to congress rapidly made converts and created great excitement throughout the country. Violent attempts were made in 1834 and subsequent years, by the opponents of emancipation, to suppress this agitation; and serious riots, attended in some instances by loss of life and destruction of property, took place in New York, Boston, Philadelphia, Cincinnati, Alton, and other northern cities. In the South the legislatures of Virginia, North and South Carolina, Georgia, Alabama, and some other states passed resolutions calling upon the northern states to suppress the agitation by penal enactments prohibiting the printing of anti-slavery publications. President Jackson, in his annual message of Dec. 1835, recommended to congress to pass a law prohibiting the circulation through the mail of anti-slavery publications; and a bill framed in accordance with this suggestion reached a third reading in the senate in 1836, but was finally rejected. In the house a rule was adopted in the same year, "that all petitions, memorials, resolutions, and propositions relating in any way or to any extent whatever to the subject of slavery, shall, without being either printed or referred, be laid on the table, and no further action whatever shall be had thereon." This rule, which was repeatedly rescinded and reenacted, led to long and excited debates on the right of petition, in which ex-president John Quincy Adams, then a representative from Massachusetts, was conspicuous in defence of that right; and the rule was finally rescinded in Dec. 1845. In 1840 a disagreement among the abolitionists led to their separation into two divisions, one of which, under the lead of Mr. Garrison, in 1844 took the position that the compromises of the constitution on the subject of slavery were immoral, and that consequently it was sinful to swear to support that instrument or to hold office or vote under it, and that the union of the states was "an agreement with hell and a covenant with death," which ought to be at once dissolved. This body, though conspicuous by the zeal, energy, and eloquence of Mr. Garrison, Mr. Wendell Phillips, and a few others of its leaders, has had—from the scantiness of its numbers, amounting to only a few hundreds, its abstinence from political action, and the unpopularity of its opinions, not only respecting the Union and the constitution, but upon woman's rights, the condition of the churches, and other questions—little or no direct influence on public affairs. The other and far more numerous division of the abolitionists, with whom the followers of Mr. Garrison were often erroneously confounded, adhered

to the Union and the constitution, and, having become satisfied that both the whig and democratic parties were completely under the control of the slaveholders, established in 1840 the "liberty party," and at a national convention held at Albany nominated James G. Birney for president and Thomas Earle for vice-president. Their entire vote at the election of that year was 7,609. At the next presidential election in 1844 Mr. Birney was again nominated for president, with Thomas Morris for vice-president, and received 63,800 votes. These figures, however, imperfectly represented the numbers of the opponents of slavery, most of whom still maintained their connection with the two great parties, on whose action they had so powerful an influence, that while the Texas question was still pending 14 northern states protested, through their legislatures, in some cases by unanimous vote of all parties, against any enlargement of the area of slavery; and in 1846, during the Mexican war, a bill being before congress authorizing the president to use the sum of \$2,000,000 in negotiating a peace, Mr. David Wilmot, a democratic representative from Pennsylvania, moved to add thereto the proviso, "That there shall be neither slavery nor involuntary servitude in any territory on the continent of America, which shall hereafter be acquired by or annexed to the United States by virtue of this appropriation, or in any other manner whatsoever, except for crime of which the party shall have been duly convicted." This proviso was adopted in the house by a large majority, nearly all the members from the free states voting for it, but failed in the senate from want of time. At the next session, 1846-7, a similar bill appropriating \$3,000,000 had the Wilmot proviso affixed to it by a vote of 115 to 106; but it was rejected by the senate by a vote of 81 to 91, and the bill being sent back to the house the proviso was abandoned by a vote of 103 to 97. On the termination of the war, the practical question involved in the Wilmot proviso, whether the introduction of slavery should be allowed or prohibited in the territories newly acquired from Mexico, became of prominent interest. In the whig national convention, held at Philadelphia in 1846, by which Gen. Taylor was nominated, there were several delegates from the northern states representing what were called "free soil" opinions, that is, opinions hostile to the extension of slavery, by whom after the nomination of candidates the following resolution was offered as an amendment to the platform of principles adopted by the convention: "Resolved, that while all power is denied to congress under the constitution to control or in any way interfere with the institution of slavery within the several states of the Union, it nevertheless has the power, and it is the duty of congress, to prohibit the introduction or existence of slavery in any territory now possessed, or which may hereafter be acquired, by the United States." This was rejected, and several

of the free soil delegates consequently withdrew from the convention, and subsequently separated themselves from the whig party. A similar schism had already taken place in the democratic national convention of the same year, the "barnburners," as the free soil democrats were termed, having seceded partly on anti-slavery and partly on personal grounds. An agreement was soon made between these seceding whigs and democrats and the liberty party to unite their forces in opposition to the extension of slavery; and a convention was accordingly held at Buffalo, Aug. 9, 1848, which was attended by delegates from all the free states and from Delaware, Maryland, Virginia, and the District of Columbia. A free soil or free democratic party was formed, and Martin Van Buren was nominated for president and Charles Francis Adams for vice-president. A platform was adopted, declaring that the new party was formed "to maintain the rights of free labor against the aggressions of the slave power, and to secure free soil to a free people; that slavery, in the several states of this Union which recognize its existence, depends upon the state laws alone, which cannot be repealed or modified by the general government, and for which laws that government is not responsible; we therefore propose no interference by congress with slavery within the limits of any state; that the only safe means of preventing an extension of slavery into territory now free is to prohibit its extension in all such territory by an act of congress; that we accept the issue which the slave power has forced upon us, and to their demand for more slave states and more slave territory, our calm but final answer is, no more slave states and no more slave territory." Van Buren and Adams received at the presidential election, in Nov. 1848, a popular vote of 291,368, but secured no electoral vote. The democratic candidates, Cass and Butler, received 127 electoral votes; and the whig candidates, Taylor and Fillmore, received 168 electoral votes, and were consequently elected.—President Taylor was inaugurated on Monday, March 5, 1849, and appointed as his cabinet John M. Clayton, secretary of state; William M. Meredith, of the treasury; George W. Crawford, of war; William B. Preston, of the navy; Thomas Ewing, of the interior (an office created by congress two days before, March 3, 1849); Jacob Collamer, postmaster-general; and Reverdy Johnson, attorney-general. One of the earliest and most difficult of the questions which pressed on the new administration arose out of the acquisition of California and New Mexico. In Feb. 1848, gold began to be found in California in large quantities, and the news of its discovery created such an excitement in the United States that in a short time thousands of emigrants were on their way thither by land and water, and their numbers were soon sufficient to constitute a state. They held a convention at Monterey, and on Sept. 1, 1849, adopted a con-

stitution with a clause prohibiting slavery. When congress assembled in December, the question of slavery gave rise to excited debates, in which several of the southern members threatened secession and civil war in case the institution was excluded from the newly acquired territories. Much agitation existed throughout the country, especially in the states on the gulf of Mexico, where the disunion party possessed considerable popular strength. An address to the people of the South, signed by most of the southern members of congress, was published, which was far from conciliatory in its tone; the legislatures of South Carolina and Mississippi issued a call for a southern congress to frame a government for a "United States South;" and a disunion convention of delegates from the southern states actually assembled at Nashville. In the North the agitation was directed not against the Union, but for its preservation, and great meetings were held in all the principal cities to protest against any further interference with slavery. President Taylor, in a message to congress, Jan. 21, 1850, stated that he had himself advised the people of California to form a constitution, and he urged congress to receive and favorably consider their application for admission into the Union. This, however, continued to be opposed by the South, and a parliamentary struggle ensued, the most violent and protracted in American history. The extreme slavery party, led by Mr. Calhoun, demanded not only the rejection of California, but, among other concessions, an amendment of the constitution that should equalize the political power of the free and slave states. The question was still further complicated by the application of New Mexico for admission, and by a claim brought forward by Texas to a western line of boundary which would include a large portion of New Mexico. Finally a compromise was proposed by Henry Clay in the senate as a final settlement of the whole question of slavery, and after a long discussion the result aimed at by Mr. Clay was attained by separate acts, which provided for: 1, the admission of California as a free state; 2, territorial governments for New Mexico and Utah without excluding slavery, but leaving its exclusion or admission to the local population; 3, the settlement of the Texas boundary question; 4, the abolition of the slave trade in the District of Columbia; 5, the enactment of a stringent law for the arrest and return of fugitive slaves. Ten of the southern senators, including Messrs. Mason and Hunter of Virginia, Soulé of Louisiana, and Jefferson Davis of Mississippi, published a final protest against the admission of California after the vote was taken; and the free soil party at the North denounced the concessions to Texas and the refusal to prohibit slavery in New Mexico and Utah as unjust and unwise, and proclaimed the fugitive slave law as immoral and cruel, and unconstitutional on the ground that the constitution gives congress no power to legislate

on the subject, but leaves the rendition of fugitives from justice and labor to the individual states. Nevertheless the great body of the people North and South acquiesced in the compromise as a final settlement of a dangerous question; and the fugitive slave law, though resisted in a few instances by mobs, was practically enforced by the authorities in all the free states where fugitives were arrested. While the compromise bills were yet before congress, President Taylor died after a few days' illness, July 9, 1850, and was succeeded by the vice-president, Millard Fillmore, who on July 15 reconstructed the cabinet as follows: Daniel Webster, secretary of state; Thomas Corwin, of the treasury; Charles M. Conrad, of war; Alexander H. H. Stuart, of the interior; William A. Graham, of the navy; Nathan K. Hall, postmaster-general; and John J. Crittenden, attorney-general. The compromise bills were signed by Mr. Fillmore Sept. 9, and the whole weight of his administration was given to their support, and especially to the enforcement of the fugitive slave law. During the remainder of his term the events of most importance were the invasion of Cuba, in Aug. 1851, by a band of "filibusters" from New Orleans, led by Gen. Lopez, who was speedily defeated, captured, and executed with many of his followers; the visit of Louis Kossuth to the United States in Dec. 1851; a dispute with England on the subject of the fisheries in 1852, which was settled by mutual concessions; and lastly the negotiation of a treaty with Japan by Commodore Perry, in command of an American fleet, by which the commerce of that empire was thrown open to the world.—On the approach of the presidential election of 1852 it became evident that notwithstanding the apparent acquiescence of the great mass of the people in the compromise measures of 1850, the question of slavery was still a source of political agitation. The democrats of the South were divided into "Union men" and "southern rights men," the latter maintaining the right of a state to secede from the Union whenever its rights were violated by the general government. On the other hand, the whigs of the South were mostly Union men and satisfied with the compromise measures, while a majority of the whigs of the North were opposed to the fugitive slave law, though not offering resistance to its execution, and were still desirous of preventing the extension of slavery by national legislation. The democratic national convention met at Baltimore, June 1, 1852, and, after balloting for 4 days, on the 49th ballot nominated for president Gen. Franklin Pierce of New Hampshire, who had commanded a brigade in the Mexican war, and was known to hold opinions satisfactory to the South on the subject of slavery. Lewis Cass and James Buchanan were the leading candidates in the previous ballottings; and William L. Marcy and Stephen A. Douglas also received considerable support.

William R. King of Alabama was nominated for vice-president. A platform was adopted by the convention declaring resistance to "all attempts at renewing in congress or out of it the agitation of the slavery question, under whatever shape or color the attempt may be made;" and also a determination to "abide by and adhere to a faithful execution of the acts known as the compromise measures settled by the last congress, the act reclaiming fugitives from service or labor included." The whig national convention met at Baltimore, June 16, and on the 58d ballot nominated for president Gen. Winfield Scott. The other candidates for the nomination were Millard Fillmore and Daniel Webster, the former receiving the votes of most of the southern delegates nearly to the close, while Scott and Webster were chiefly supported by the northern delegates. William R. Graham was nominated for vice-president. The platform adopted by the convention declared that "the series of acts of the 32d congress, the act known as the fugitive slave law included, are received and acquiesced in by the whig party of the United States as a settlement in principle and substance of the dangerous and exciting questions which they embrace; . . . and we deprecate all further agitation of the question thus settled, as dangerous to our peace, and will discountenance all efforts to continue or renew such agitation, whenever, wherever, or however the attempt may be made." Mr. Webster and his especial friends did not cordially acquiesce in the nomination of Gen. Scott, and attempts were made in various places to bring Mr. Webster forward as an independent candidate for the presidency, chiefly by whigs who considered Gen. Scott and his intimate political friends as lukewarm in their support of the compromises; but the death of Mr. Webster, Oct. 24, 1852, before the election, rendered these demonstrations useless. The national convention of the free soil party was held at Pittsburg, Aug. 11, all the free states being represented, together with Delaware, Maryland, Virginia, and Kentucky. John P. Hale was nominated for president and George W. Julian for vice-president. A platform was adopted declaring "that the acts of congress known as the compromise measures of 1850, by making the admission of a sovereign state contingent upon the adoption of other measures demanded by the special interest of slavery; by their omission to guarantee freedom in the free territories; by their attempt to impose unconstitutional limitations on the power of congress and the people to admit new states; and by their invasion of the sovereignty of the states and the liberties of the people through the enactment of an unjust, oppressive, and unconstitutional fugitive slave law, are proved to be inconsistent with all the principles and maxims of democracy, and wholly inadequate to the settlement of the questions of which they are claimed to be an adjustment. That no permanent settlement

of the slavery question can be looked for except in the practical recognition of the truth that slavery is sectional and freedom national; by the total separation of the general government from slavery, and the exercise of its legitimate and constitutional influence on the side of freedom; and by leaving to the states the whole subject of slavery and the extradition of fugitives from justice." At the election, Nov. 5, 1852, the democratic candidates, Pierce and King, received the votes of 27 states, casting 254 electoral votes. Scott and Graham received the votes of Vermont, Massachusetts, Kentucky, and Tennessee, with 42 electoral votes. The popular vote for Pierce and King was 1,587,256, for Scott and Graham 1,884,577, and for Hale and Julian 157,296. President Pierce was inaugurated March 4, 1853, and appointed as his cabinet William L. Marcy, secretary of state; James Guthrie, of the treasury; Jefferson Davis, of war; James O. Dobbin, of the navy; Robert McClelland, of the interior; James Campbell, postmaster-general; and Caleb Cushing, attorney-general. Mr. Buchanan was sent as minister to England and Mr. Soulé to Spain. One of the first questions that occupied the administration was a boundary dispute with Mexico concerning a tract of land between New Mexico and Chihuahua, which finally by negotiation and purchase became a part of the United States under the name of Arizona. In 1853, under the direction of Jefferson Davis, secretary of war, various expeditions were sent out to explore the routes proposed for a railroad from the Mississippi to the Pacific. Congress assembled in Dec. 1853, and in the following January Mr. Douglas, chairman of the senate committee on territories, introduced a bill for the organization of two new territories, Kansas and Nebraska, in the region west of Missouri and north of lat. 36° 30'. By this bill the Missouri compromise act of 1820 was repealed, and slavery allowed to enter where it had been formally and for ever excluded. The measure was warmly supported by the administration and by the leaders of the democratic party, and was strenuously opposed in debates of unprecedented length and interest by Chase and Wade of Ohio, Everett and Sumner of Massachusetts, Seward of New York, Fessenden of Maine, Houston of Texas, and Bell of Tennessee, in the senate, where it finally passed by a vote of 37 to 14. In the house it was opposed among others by Thomas H. Benton of Missouri, who, for 30 years a senator, had now become a representative; but it passed by a vote of 113 to 100, and the bill became a law on the last day of May. This bill roused great excitement and indignation in the free states, where it was denounced as a flagrant breach of faith, and its enactment greatly increased the strength of the anti-slavery party. Much dissatisfaction also was caused in those states by a conference at Ostend between the U. S. ministers to England, France, and Spain, in the circular

issued by which it was proposed to buy Cuba from Spain for \$120,000,000, or, if necessary to prevent emancipation in the island, to take it by force. The attempt to obtain Cuba was regarded at the North as prompted, like the repeal of the Missouri compromise, chiefly by a desire to extend and strengthen the slaveholding influence in the United States. So also were the filibuster expeditions against Nicaragua led by William Walker, whose envoy, Vijil, at Washington was formally recognized by the president in 1856. (See WALKER, WILLIAM.) As, by the terms of the Kansas and Nebraska act, the people of those territories were to be left free to determine for themselves whether or not slavery should be tolerated there, a struggle soon began in Kansas, to which chiefly emigration was directed, between the anti-slavery and pro-slavery parties, which, after many acts of violence and a long period of confusion amounting almost to civil war, terminated in the adoption by the people of Kansas of a state constitution excluding slavery. (See KANSAS.) In the course of the debates on the Kansas question Mr. Sumner of Massachusetts made in the senate, May 20, 1856, a speech containing a vehement attack on South Carolina and some of her representatives, for which two days afterward he was assailed in the senate chamber by Preston S. Brooks of that state, and so much injured that he was not able to resume his duties in the senate during that and the succeeding session. This event increased still further the anti-slavery feeling at the North, and when the canvass for president began in 1856, an anti-slavery party appeared in the field of far more formidable dimensions than any previous organization of the kind. This party assumed the name of republican, and absorbed the entire free soil party, the greater part of the whig party, and considerable accessions from the democratic party. The first decisive exhibition of its strength was the election in the congress of 1855-'6 of N. P. Banks, a former democrat, as speaker of the house of representatives. The whig party about this period disappeared from the field, that portion of it opposed to anti-slavery measures having been merged, especially in the South in an organization at first popularly known as the "Know-Nothing party," and then as the American party from its opposition to foreign influence, and particularly to Roman Catholic influence, in our political affairs. This party held a national convention at Philadelphia in Feb. 1856, and, after adopting a platform virtually recognizing the principles of the Kansas-Nebraska act and approving the fugitive slave law, nominated Millard Fillmore for president. The democratic national convention met at Cincinnati, June 2, and reaffirmed the Baltimore platform of 1852, with the addition of resolutions condemning the principles of the American party, recognizing the Kansas-Nebraska act as the only safe solution of the slavery question, affirming the duty of upholding

state rights and the Union, and assenting generally to the doctrines of the Ostend circular. The candidates for the nomination for president were Franklin Pierce, James Buchanan, Stephen A. Douglas, and Lewis Cass. On the 17th ballot Mr. Buchanan was unanimously nominated, and John C. Breckinridge of Kentucky was also unanimously chosen candidate for the vice-presidency. The republican national convention met at Philadelphia, June 17, and adopted a platform declaring that "the maintenance of the principles promulgated in the declaration of independence and embodied in the federal constitution is essential to the preservation of our republican institutions, and that the federal constitution, the rights of the states, and the union of the states shall be preserved;" and that "the constitution confers upon congress sovereign power over the territories of the United States for their government, and in the exercise of this power it is the right and the duty of congress to prohibit in the territories those twin relics of barbarism, polygamy and slavery." John C. Fremont was nominated for president by 359 votes against 196 for John McLean; and William L. Dayton was nominated for vice-president, his principal competitors being Abraham Lincoln, N. P. Banks, Charles Sumner, and David Wilmot. After an animated canvass, the election resulted in the choice of Buchanan and Breckinridge by 174 electoral votes against 114 for Fremont and 8 for Fillmore. The popular vote for Buchanan was 1,838,169, for Fremont 1,841,264, and for Fillmore 874,534. Fillmore received the vote of Maryland, Buchanan the votes of all the other slave states and of New Jersey, Pennsylvania, Indiana, Illinois, and California, and Fremont those of the 11 remaining free states.—President Buchanan appointed as his cabinet Lewis Cass, secretary of state; Howell Cobb, of the treasury; John B. Floyd, of war; Isaac Toucey, of the navy; Jacob Thompson, of the interior; Aaron V. Brown, postmaster-general; and Jeremiah S. Black, attorney-general. With the exception of a rebellion of the Mormons in Utah in 1857-'8, which was suppressed without bloodshed, of the admission into the Union of Minnesota in 1858 and of Oregon in 1859, and of an unsuccessful attempt to purchase Cuba, the chief interest of Mr. Buchanan's administration centered around the slavery controversy, which still continued in Kansas, in the halls of congress, and in the legislatures of the free states. Several of the latter bodies, under the influence of a public opinion which had been gradually growing in opposition to the justice and constitutionality of the fugitive slave law, passed acts designed to impede its operation, and to secure to alleged fugitives the right to trial by jury and to the legal assistance usually given to those charged with criminal offences. These acts were commonly called personal liberty laws, and though they have never in any case been put in practical opera-

tion, their existence soon became a subject of complaint on the part of the South against the northern states. A constitution for Kansas framed at Leocompton in 1857 was laid before congress in the session of 1857-'8, and was strongly opposed by the republicans on the ground that it had been fraudulently concocted by the pro-slavery party there, that it did not represent the wishes of the people of Kansas, and that some of its provisions were cunningly framed for the purpose of forcing slavery into the new state in spite of the opposition of the inhabitants. A powerful section of the democratic party, headed by Stephen A. Douglas, sided with the republicans in this matter; but the so called "Leocompton bill," after a parliamentary struggle of extraordinary intensity and duration, was passed by congress by the votes of the democratic majority, led in the house by Alexander H. Stephens of Georgia, and in the senate by Jefferson Davis of Mississippi, John M. Mason of Virginia, and John Slidell of Louisiana. The president lent all his influence to the measure, on the ground that it would pacify the country, and would not prevent Kansas from becoming a free state if the people desired to exclude slavery. This contest, however, resulted in a schism in the democratic party, and eventually in its division into two bodies, one of which looked upon Mr. Douglas as its leader, while the other supported for the presidency John C. Breckinridge of Kentucky. An attempt to excite the slaves to insurrection, made at Harper's Ferry in Oct. 1859, by John Brown of Kansas, for which he was hanged by the authorities of Virginia, Dec. 2, created a profound sensation throughout the country, and caused especial excitement at the South, where it was looked upon by many as indicative of a settled purpose at the North to destroy slavery. (See HARPER'S FERRY.)—The democratic national convention met at Charleston, April 28, 1860, and after a stormy session of 10 days the southern delegates withdrew on the refusal of the northern delegates to agree to a platform conceding to their fullest extent the claims of the slaveholders to carry slavery into the territories. The convention reassembled at Baltimore, June 18, but could not agree, and another secession took place, embracing most of the southern delegates. The convention, however, continued in session, and nominated for president Stephen A. Douglas of Illinois, and for vice-president Herschel V. Johnson of Georgia. The seceders also met in convention on June 28, and nominated for president John C. Breckinridge of Kentucky, and for vice-president Joseph Lane of Oregon. The "constitutional union party," composed mainly of the American party, held its national convention at Baltimore May 9, and nominated for president John Bell of Tennessee, and for vice-president Edward Everett of Massachusetts. This party declared that it recognized "no political principle other than the constitution of the country, the union of the states, and the enforce-

ment of the laws." The republican national convention assembled at Chicago on May 16, and nominated for president Abraham Lincoln of Illinois. His principal competitors for the nomination were W. H. Seward, Simon Cameron, Edward Bates, and S. P. Chase. Hannibal Hamlin of Maine was nominated for vice-president, the other candidates being Cassius M. Clay, N. P. Banks, A. H. Reeder, and John Hickman. The platform adopted by the convention declared that "the maintenance of the principles promulgated in the declaration of independence and embodied in the federal constitution is essential to the preservation of our republican institutions, and that the constitution, the Union, and the rights of the states must and shall be preserved;" and "that the maintenance inviolate of the rights of the states, and especially of the right of each state to order and control its own domestic institutions according to its own judgment exclusively, is essential to that balance of power on which the perfection and endurance of our political fabric depends." The platform also denounced John Brown's invasion of Virginia as lawless and unjustifiable, declared that "the new dogma that the constitution, of its own force, carries slavery into any or all of the territories of the United States, is a dangerous political heresy," and denied "the authority of congress, of a territorial legislature, or of any individuals to give legal existence to slavery in any territory of the United States." The result of the presidential election of Nov. 1860, was that Mr. Lincoln received the electoral votes of all the free states (except three votes in New Jersey, which were given to Mr. Douglas), to the number of 180, and was elected. Mr. Bell received the votes of Virginia, Kentucky, and Tennessee, 89; Mr. Douglas the 9 votes of Missouri, which added to 8 from New Jersey gave him a total of 12 votes; and the remaining southern states cast their 72 electoral votes for Breckinridge. The popular vote for Lincoln was 1,857,610, for Douglas about 1,865,976, for Breckinridge 847,952, and for Bell 590,631. On Nov. 10, when this result was known, the legislature of South Carolina ordered the election of a convention to consider the question of secession. The convention assembled Dec. 17, and on Dec. 20 adopted a secession ordinance, declaring that "the union now subsisting between South Carolina and other states, under the name of the United States of America, is hereby dissolved." A declaration of the reasons for secession was issued by the convention, in which it was said: "We assert that 14 of the states have deliberately refused for years past to fulfil their constitutional obligations, and we refer to their own statutes for proof. . . . In many of these states the fugitive is discharged from the service of labor claimed, and in none of them has the state government complied with the stipulations made in the constitution. . . . Thus the constitutional compact has been deliberately broken and disregarded by the non-

slaveholding states; and the consequence follows that South Carolina is released from her obligation." No allusion was made in this declaration to the tariff or to any other causes of complaint than those above alleged and "the election of a man to the high office of president of the United States whose opinions and purposes are hostile to slavery." A few days afterward the state forces seized the U. S. custom house, post office, and arsenal in Charleston, and Forts Pinckney and Moultrie in the harbor of that city, Major Anderson, the U. S. commander, who had only about 80 men, having withdrawn his command into Fort Sumter. The movements of South Carolina were rapidly imitated by other slave states. Mississippi seceded Jan. 9, Florida Jan. 10, Alabama Jan. 11, Georgia Jan. 19, Louisiana Jan. 26, and Texas Feb. 1. Everywhere throughout these states the arsenals, custom houses, navy yards, and forts belonging to the United States were seized by the secessionists, with the exception of Fort Sumter, and Fort Pickens in Florida, which last was preserved by the decided action of Lieut. Slemmer, its commander. The posts at the southern extremity of Florida also remained in the hands of the government. The army at the beginning of active measures on the part of the South was only 16,000 strong, and by orders from Mr. Floyd, the secretary of war, who was himself a party to the secession movement, had been dispersed in the remotest parts of the country, while the navy was mostly absent on foreign stations. Under Mr. Floyd's orders also an extensive transfer of arms from northern to southern arsenals was made during 1860, 115,000 muskets having been transferred by one order, and great quantities of cannon and ammunition by other orders. Congress assembled at Washington, Dec. 8, 1860, and the president's annual message was mainly devoted to the consideration of the secession movement. He recommended, as the most effectual mode of stopping the revolution, an amendment of the constitution embracing these three points: 1, an express recognition of the right of property in slaves in the states where it now exists or may hereafter exist; 2, the duty of protecting this right in all the common territories throughout their territorial existence, and until they shall be admitted as states into the Union with or without slavery as their constitutions may prescribe; 3, a like recognition of the right of the master to have his slave, who has escaped from one state to another, restored and delivered up to him, and of the validity of the fugitive slave law enacted for this purpose, together with a declaration that all state laws impairing or defeating this right are violations of the constitution and are consequently null and void. "Such an explanatory amendment would, it is believed, for ever terminate the existing dissensions, and restore peace and harmony among the states." This part of the message was referred in the senate to a committee of 18, who reported on Dec. 31 that they had not been able to agree upon any

general plan of adjustment. Mr. Crittenden, senator from Kentucky, and a leader of the American party, introduced on Dec. 18 a plan of compromise, proposing to renew the Missouri line of $36^{\circ} 30'$; to prohibit slavery north and permit it south of that line; to admit new states with or without slavery as their constitutions might provide; to prohibit congress from abolishing slavery in the states and in the District of Columbia so long as it exists in Virginia or Maryland; to permit free transmission of slaves by land or water in any state; to pay for fugitive slaves rescued after arrest; to ask the repeal of personal liberty laws in the states; these concessions to be submitted to the people as amendments to the constitution, and if adopted never to be changed. These were rejected, and the following resolutions, offered by Mr. Clark of New Hampshire, a republican senator, adopted: "That the provisions of the constitution are ample for the preservation of the Union, and the protection of all the material interests of the country; that it needs to be obeyed rather than amended; and that an extrication from the present dangers is to be looked for in strenuous efforts to preserve the peace, protect the public property, and enforce the laws, rather than in new guarantees for particular interests, compromises for particular difficulties, or concessions to unreasonable demands. That all attempts to dissolve the present Union, or overthrow or abandon the present constitution, with the hope or expectation of constructing a new one, are dangerous, illusory, and destructive; that, in the opinion of the senate of the United States, no such reconstruction is practicable, and therefore to the maintenance of the existing union and constitution should be directed all the energies of all the departments of the government, and the efforts of all good citizens." These resolutions expressed substantially the position of the republicans in congress, who had become the majority in both houses by the withdrawal of the democratic senators and representatives from the seceded states. About the time that they were adopted, the legislature of Virginia passed resolutions recommending each of the states to appoint commissioners to a convention, the object of which should be "to adjust the present unhappy controversies." This proposition was approved by the president and most of the loyal states promptly responded by appointing delegates. None appeared from the seceded states. The convention assembled at Washington, Feb. 4, 1861, and chose John Tyler of Virginia as chairman. After a session of 8 weeks the convention laid before congress a series of proposed amendments to the constitution, to the following effect: 1, prohibiting slavery N. of lat. $36^{\circ} 30'$ in territories, but tolerating it in states, and forbidding all congressional or territorial legislation against slavery S. of that line; 2, prohibiting any future acquisition of territory without the concurrence of a majority of senators both from slave and free

ates; 3, prohibiting congress from regulating, polishing, or controlling slavery within any state, from interfering with or abolishing slavery in the District of Columbia or other places under exclusive federal jurisdiction, and from taxing slaves at a higher rate than land; 4, authorizing the states to enforce the rendition of fugitive slaves; 5, prohibiting the foreign slave trade. Another section provided for the payment from the U. S. treasury of the value of a fugitive slave whose rendition was prevented by mobs or by any violence or intimidation. The first, third, and fifth of these sections were to be permanent parts of the constitution, not to be abolished or amended without the consent of all the states. These propositions, however, were all rejected by congress, which had long had under consideration a variety of similar measures, all of which failed to secure a sufficient number of votes. The following amendment to the constitution was however recommended by the house by a two thirds vote of 188 to 65: "No amendment shall be made to the constitution which will authorize or give to congress the power to abolish or interfere within any state with the domestic institutions thereof, including that of persons held to service or labor by the laws of said state." While these discussions were going on in congress, the cabinet of President Buchanan was disturbed and perplexed on the subject of reinforcing the forts in Charleston harbor, a measure opposed with the utmost pertinacity by Mr. Floyd, the secretary of war, and insisted upon by Gen. Cass, the secretary of state, who on Dec. 14 resigned his office in consequence of the president's refusal to order reinforcements. Four days before, Howell Cobb, the secretary of the treasury, had resigned and returned to his residence in Georgia, where he immediately took an active part in the secession movement. His place was filled by Philip F. Thomas of Maryland, while Mr. Black, the attorney-general, was appointed temporary secretary of state. Shortly afterward, on the unexpected movement of Major Anderson from Fort Moultrie to Fort Sumter, and the president's refusal to comply with his demand for the entire withdrawal of the garrison from Charleston harbor, Mr. Floyd resigned, and Joseph Holt, who had been appointed postmaster-general on the death of Aaron V. Brown in 1859, was authorized to administer the affairs of the war department. Not long after Mr. Floyd's resignation he was indicted by the grand jury of the District of Columbia as being privy to the abstraction of bonds to the amount of \$870,000 from the department of the interior in the latter part of 1860. His services to the cause of secession by supplying the southern states with arms from northern arsenals had been of the highest value, and he was soon made a brigadier-general in the army of the seceded states. On Dec. 29 commissioners from South Carolina, who had recently arrived in Washington, endeavored to open

negotiations with the president for the surrender to South Carolina of the U. S. forts and other national property within her borders. The president declined to receive them as commissioners, or to surrender or evacuate Fort Sumter, and permitted his cabinet to make an attempt to send reinforcements to Major Anderson by the steamer *Star of the West*, which left New York Jan. 5, 1861, and arrived off Charleston on the morning of the 9th; but she was fired at from batteries manned by the forces of the state, and compelled to retire without effecting her purpose. This led to the immediate resignation of Jacob Thompson, secretary of the interior, and his return to his own state of Mississippi, from the revolutionary government of which he had while still in office received and acted upon a commission to visit and promote the secession of North Carolina. A few days later Mr. Thomas, also disapproving of the attempt to reinforce Fort Sumter, withdrew from the treasury department, and was succeeded by John A. Dix of New York, who was believed to be in favor of vigorous measures for maintaining the authority of the government. The legislatures of New York, Ohio, and Massachusetts at this time offered the whole military power of those states to the president, while the South Carolina legislature declared that any attempt to reinforce Fort Sumter would be an act of war. No further attempt, however, was made at reinforcement during the administration of President Buchanan, which came to an end March 4, 1861. On the same day Mr. Lincoln was inaugurated at Washington without any disturbance of the peace, for the preservation of which a small military force had been assembled under the direction of Gen. Scott. In his inaugural address the president began by declaring that the accession of a republican administration afforded no ground to the southern states for apprehending any invasion of their rights. He said: "I have no purpose, directly or indirectly, to interfere with the institution of slavery in the states where it exists. I believe that I have no lawful right to do so, and I have no inclination to do so. Those who nominated and elected me knew that I had made this and many similar declarations, and had never recanted them." He proceeded to argue that no state upon its own mere motion can lawfully go out of the Union; that resolves and ordinances to that effect are legally void; and that acts of violence within any state or states against the authority of the United States are insurrectionary or revolutionary according to circumstances. "I therefore consider that in view of the constitution and the laws, the Union is unbroken; and to the extent of my ability I shall take care, as the constitution itself expressly enjoins upon me, that the laws of the Union be faithfully executed in all the states." President Lincoln appointed as his cabinet William H. Seward, secretary of state; Salmon P. Chase, of the treasury; Simon Cam-

About the middle of July the troops in and around Washington, to the number of 40,000, under command of Gen. Irvin McDowell, began to move toward Manassas Junction, where Gen. Beauregard was intrenched with 27,000 men. Gen. Patterson at the same time was posted near Winchester, about 50 m. N. W. of Manassas, with instructions to hold in check the confederate general Joseph E. Johnston, who was stationed there with 16,000 men. McDowell's corps was reduced by the necessity of holding open his lines of communication, by the return of the three months' militia, and by other causes, to such an extent that on reaching Bull run, a small stream near Manassas, he had but 18,000 men left. A severe battle was fought here July 21, victory inclining to the federal side until late in the afternoon, when Gen. Johnston, having eluded Patterson, effected a junction with Beauregard, and the national army was seized with a sudden panic and utterly routed. Their loss was 481 killed, 1,011 wounded, 1,200 prisoners, 27 cannon, and 4,000 muskets; the loss on the other side, according to official report, was 269 killed and 1,488 wounded. The next day Gen. McClellan was placed in command of the army of the Potomac, and soon began to reorganize and discipline his forces, in which the rest of the summer and the following winter were quietly passed. Immediately after the battle of Bull run, congress, which had met in extra session July 4, voted to raise 500,000 men, to serve for three years or the war, and the loyal states answered to the call with even greater enthusiasm than had been aroused at the fall of Fort Sumter. On Aug. 16 the president issued a proclamation forbidding intercourse with the seceded states. The same day Gen. Wool took command at Fortress Monroe, where a considerable force of northern troops had been for some time collected under Gen. Butler. The southern army soon after the battle of Bull run advanced their lines almost within gunshot of Washington, the federal forces remaining encamped partly on Arlington heights and partly on the N. side of the Potomac, above and below Washington. Meanwhile the military operations in other parts of the country were attended with varying success. On Aug. 28 and 29 Forts Hatteras and Clark, at Hatteras inlet, the main entrance to Pamlico sound on the coast of North Carolina, were bombarded and taken by a naval expedition under Com. Stringham; and the day after the confederates evacuated Fort Morgan, at Ocracoke inlet, another entrance to the same waters. A naval expedition under Flag Officer Samuel F. Dupont, consisting of 84 vessels including transports, and carrying 20,000 troops under Gen. T. W. Sherman, sailed from Hampton roads on Oct. 29 for Port Royal harbor, near Beaufort, S. C., and on Nov. 7 attacked Forts Walker and Beauregard at the entrance to the harbor. The attack was made by 16 vessels, sailing in an ellipse between the two forts, and deliver-

ing fire at each alternately, and resulted after 3 hours' fight in the precipitate flight of the garrisons, leaving between 40 and 50 guns in the possession of the victors. The finest harbor on the southern coast was thus secured as a rendezvous for the blockading squadron, as a base for further operations. Missouri during these events had been almost in a condition of anarchy. Notwithstanding the neutrality which the state had determined to preserve, the governor, Claiborne F. Jackson, and a majority of the legislature, were acting in the interest of the southern confederacy, and having fled from Jefferson City, the seat of government, on the approach of federal troops, were deposed by a state convention, July 30, Hamilton R. Gamble being appointed provisional governor. Gov. Jackson proceeded to Arkansas, where confederate troops were concentrating under Gen. McCulloch for an advance into Missouri. On July 5 a detachment of them under Gen. Rains was defeated at Carthage, in the S. W. part of Missouri, by Col. (now Gen.) Sigel, and on Aug. 10 another battle was fought at Wilson's creek, or Dug Spring, near Springfield, in the same part of the state, in which the federal general Lyon was killed. Col. Sigel, upon whom the command then devolved, fell back to Rolla, near the centre of the state, and the whole of S. Missouri, with its valuable lead mines, was thus abandoned to the enemy. In the mean time Gen. Fremont had been appointed to the command of the western department (July 9), and on Aug. 31 proclaimed martial law in all that part of Missouri which was occupied by the national army. A memorable incident of the struggle in Missouri was the defence of Lexington, on the Missouri river in the W. part of the state, by 2,700 men under Col. James B. Mulligan, who held out for 3 days against an army of 26,000 commanded by Sterling Price, and only surrendered (Sept. 20) after they had been two days cut off from their supplies of water. A month later, having organized a force after almost incredible difficulties, Fremont took the field and drove the confederates by degrees back to the S. W. corner of the state. On the eve of a battle which was to decide the possession of Missouri, he was superseded by Gen. Hunter (Nov. 2), and the Union army again retreated toward St. Louis, the enemy under Gen. Sterling Price advancing as they receded. On the 18th Gen. Halleck took command of the department, and by the end of December Price was again in full retreat toward Arkansas, losing within a few days 2,500 prisoners and a large amount of stores. About Oct. 1 the confederate army before Washington began to fall back, and the national lines to be pushed forward. On the 21st a portion of Gen. Stone's command, having crossed the Potomac at Ball's bluff or Edwards's ferry, about midway between Harper's Ferry and Washington, was disastrously defeated by the confederate general Evans, with a loss of 900 out of 2,100 men. Col. E. D. Baker, U. S. senator from Oregon,

was among the killed. On Nov. 1 Gen. Scott, general-in-chief of the armies of the United States, retired from active service, and was succeeded by Gen. George B. McClellan. About his time the Union men of East Tennessee, who had been hitherto kept in subjection by the secession party, began to make various demonstrations of loyalty to the Union, and destroyed a number of bridges on the confederate lines of communication. On Nov. 6 the confederate states held an election for president and vice-president under their permanent constitution. Davis was chosen president and Stephens vice-president for the term of 6 years, and were inaugurated in the following February. On Nov. 8 Capt. Charles Wilkes, in command of the frigate *San Jacinto*, while searching for privateers in the West Indies, intercepted the British mail steamer *Trent* from Havana for Southampton, and on his own responsibility forcibly took them on board Messrs. Mason and Slidell, commissioners from the southern confederacy to England and France. The action was resented by the British government as an insult to their flag, and produced a great display of feeling against the United States; and a war with England seemed imminent, when the president decided to surrender the commissioners to the British minister, holding that although the commissioners were contraband of war, on the principles which the British government had formerly maintained and never openly renounced, yet on the principles of international law uniformly advocated by the United States, Capt. Wilkes had no right to seize their persons without taking the vessel on which they were found into port to be condemned by a prize court. On Dec. 20 Brig. Gen. Ord routed the confederates with heavy loss at Dranesville, on the road from Washington to Leesburg. By the end of the year the United States had enlisted about 640,000 men, without counting the 77,000 militia called out in April, who had been discharged at the end of their 3 months' service, nor the regular army, which it was estimated amounted at that time to 20,000. In July the army of the Confederate States had been officially returned as 210,000 strong, and President Davis had been authorized to accept 400,000 more volunteers. The contest had extended along the whole boundary line between the loyal and the seceding states, and both sides had been making vigorous preparations for a struggle for the possession of the Mississippi river. The federal troops had a base of operations at Cairo, Ill., where the Ohio and the Mississippi unite, and under orders of the war department were fitting out at that point a formidable fleet of gun and mortar boats. The whole river, from a spot a few miles below Cairo to its mouth, was in the possession of the confederates. The soil of Kentucky had hitherto been respected as neutral by both parties; but about Sept. 1 Bishop Polk of Louisiana, who had received a commission as major-general in the confederate army,

occupied Hickman and Columbus on the Mississippi, and began to fortify them. Gen. Grant, commander of the federal forces at Cairo, immediately took possession of Paducah, on the Ohio just below the mouth of the Tennessee. Within a few days Gen. Zollicoffer led a confederate force from Tennessee into S. E. Kentucky, where on Oct. 21 he was defeated at Camp Wild Cat by a small body of federals under Gen. Schoepf; and Gen. Buckner occupied Bowling Green, a place of great natural strength at the junction of the railroads from Memphis and Nashville to Louisville, about the centre of the S. part of the state. These positions formed part of a line of posts commencing at the Mississippi river and stretching through S. Kentucky and N. Tennessee to Cumberland Gap, an important pass in the Cumberland mountains near the spot where the W. boundary of Virginia touches the boundary between Tennessee and Kentucky. The principal military positions on this line were Columbus on the Mississippi, Fort Henry on the Tennessee, Fort Donelson on the Cumberland, Bowling Green, and Mill Spring in S. Kentucky. On Dec. 17 a Union victory was gained at Munfordsville on Green river, near the centre of Kentucky; and on Jan. 19, 1862, Gen. Thomas achieved a more decisive success at Mill Spring, or Somerset, where Zollicoffer's army, of which Gen. George B. Crittenden then held the chief command, was routed, and Zollicoffer himself was killed. On Jan. 20 Simon Cameron resigned the office of secretary of war, and Edwin M. Stanton of Pennsylvania was appointed in his place. On Feb. 6 Capt. Foote with a fleet of gunboats reduced Fort Henry, Gen. Tilghman with his staff and about 60 men becoming prisoners of war. On the 15th Bowling Green was evacuated, the forces retiring to Fort Donelson, which was assaulted by Gen. Grant and surrendered next day, Gen. Buckner and 16,000 men falling into his hands. The evacuation of Nashville, Tenn., followed as a necessary consequence on the 25th, and that of Columbus about March 1. The whole of Kentucky and a part of Tennessee were thus secured by the federal arms. The legislature and executive officers of Tennessee fled from Nashville to Memphis, and Senator Andrew Johnson was appointed by President Lincoln military governor of the state, with the rank of brigadier-general. An unexpectedly strong Union sentiment was at once discovered in the western as well as the eastern counties; the city council of Nashville requested the mayor to have the U. S. flag displayed on all the public buildings (April 14), and a number of the principal citizens issued a call (May 4) for a public meeting to take measures for the reestablishment of the federal authority in Tennessee. While these events were taking place, another naval and military expedition was fitted out and placed under the command of Gen. Burnside. It sailed from Hampton roads, Jan. 12, entered Pamlico sound by way of Hatteras inlet,

and attacked Roanoke Island, which separates Pamlico from Albemarle sound, and which the confederates had strongly fortified. The attack was opened Feb. 7 by the gunboat fleet under Flag Officer Goldsborough; and while the bombardment was in progress the troops landed, stormed the intrenchments, and obliged 2,500 of the enemy to surrender. On the 8th the fleet passed up the sound to Elizabeth City, N. C., captured one and destroyed 4 of the 7 gunboats forming the confederate flotilla, and occupied several towns in North Carolina. On March 14 Gen. Burnside captured Newbern, N. C., after a severe battle, taking 200 prisoners and 64 guns, and immediately afterward marched a force by land thence to Beaufort, the best harbor in that state. The town made no resistance, but Fort Macon, which defends the entrance to it from the sea, held out until April 25. From Port Royal expeditions under Capt. Dupont proceeded to the principal seaports of Florida, all of which were occupied with little or no resistance, and operations were pushed forward for the capture of Savannah. Its principal defence, Fort Pulaski, on the Savannah river, was taken April 11, but the federal forces made no immediate movement toward the city itself. On Feb. 18 the right wing of the army of the Potomac, under Gen. Banks, crossed the river at Harper's Ferry and advanced to Charlestown. On March 6 Gen. McClellan began a movement toward Richmond, the enemy falling back as he advanced, and taking up a new line of defence along the Rappahannock. Centreville was occupied on the 11th, and Manassas immediately after. While McClellan's headquarters were still at Fairfax Court House, near Manassas, the rear of his army was quietly embarking at Alexandria for Fortress Monroe, but the movement was soon suspected and guarded against by the enemy. From Fortress Monroe he advanced upon Yorktown (April 4), which was well fortified, and held by a division under Gen. Magruder. The organization of the army was now changed. Gen. McClellan, having taken the field, was relieved from the command of the other military departments, and several new departments were created. Gen. Halleck was assigned to the department of the West; Gen. Hunter to the department of the South, comprising South Carolina, Georgia, and Florida; Gen. Butler to the department of the Gulf; Gen. Fremont to the mountain department in western Virginia and eastern Tennessee; Gen. Banks to the department of the Shenandoah; Gen. McDowell to the department of the Rappahannock; and Gen. McClellan to the department of the Potomac. The frigate Merrimac, which the confederates had equipped as an iron-clad floating battery and ram, on March 8 attacked the United States vessels in Hampton roads. The sailing vessels Congress and Cumberland opened their broadsides upon her without effect, the shot rattling upon her iron sides like hail. She first ran into the Cumber-

land, which she sank after a short but terrible fire; and then attacked the Congress, which in the course of half an hour was run ashore and compelled to strike her flag, after which she was burned. The steam frigate Minnesota ran aground early in the action, and could not come within range. During the night, which put a stop to the work of destruction, Capt. Ericsson's new iron-clad battery Monitor arrived from New York, and the next morning engaged the Merrimac as she was about opening an attack upon the Minnesota. The battle lasted 5 hours, the two vessels several times touching each other, and firing without apparent effect. The Merrimac was finally compelled to retire, after receiving considerable injury from a shot which entered one of her ports. The only damage on board the Monitor was caused by a shot which struck the pilot house and wounded the commander, Lieut. Worden, by driving particles of cement into his eyes. The vessel herself was struck over 20 times, but was entirely uninjured. With the exception of an attack upon some small unarmed merchant vessels, the confederate fleet at Norfolk, which comprised beside the Merrimac the iron-clad steamers Jamestown and Yorktown, made no further movements. In the West the military operations had lost nothing of their importance. A decisive victory was gained by the national forces under Gen. Curtis at Pea Ridge, Ark., March 6, 7, and 8, over the armies of Van Dorn, Price, and McCulloch, which had just been driven out of Missouri. After the evacuation of Columbus and Nashville the confederates took up two strong positions: one at New Madrid, Mo., on the Mississippi, and at Island No. Ten in the river a few miles above that town; and the other at Corinth, in the N. E. corner of Mississippi, near the Tennessee river. New Madrid was taken by Gen. Pope, March 14, and Island No. Ten was attacked by the gunboat fleet of Flag Officer Foote on the 16th. The defences here proved unexpectedly strong. The gunboats were all above the island, and consequently, in the swift current of the Mississippi, could not attack the batteries in the only way they were fitted to attack at short range, namely, with "head on." Gen. Pope at New Madrid was unable to cooperate in a land attack, because the inundated condition of the country prevented his marching his army above the island to the neighborhood of the fleet; and at New Madrid he had no means of crossing the river to the Kentucky shore, where a confederate force was posted. The difficulty was overcome by cutting a canal 19 miles long through the neck of land formed by a bend in the river opposite the island, thus enabling several transports from Foote's fleet to reach New Madrid. Two of the gunboats ran past the batteries in the night, and the crossing having been effected under their protection, the island surrendered on the night of April 7-8, with about 6,000 prisoners, 124 guns, and a great quantity of stores. The main body of the

western army under Gen. Grant meanwhile pushed forward toward the confederate position at Corinth. On the 6th their advance guard was attacked at Shiloh, near Pittsburg Landing, on the Tennessee, a few miles from Corinth, by A. S. Johnston and Beauregard. The battle raged from 2 o'clock in the morning until the approach of night, with varying success, but with disadvantage on the whole to the federal troops, who were driven back to the river, where the gunboats enabled them to make a stand. Gen. Johnston was among the killed. During the night both sides were reinforced, and the battle was renewed at 7 the next morning. After a contest of 8 hours the confederate forces broke under a charge of 6 regiments led by Gen. Grant in person, and retreated toward Corinth, closely pursued by the cavalry. At Corinth they had erected works of a quite formidable character, and here they remained for nearly two months, the national army, which had been largely increased and was now commanded by Gen. Halleck, slowly advancing toward their position. Gen. O. M. Mitchel in the mean time, with a small body of federal troops, seized Huntsville on the main line of the Memphis and Charleston railroad in northern Alabama, capturing 200 prisoners, 15 locomotives, and a large number of cars, and in the course of two or three days had occupied 100 miles of the same road, thus cutting off all direct communication between the S. Atlantic states and the West. The entrance of the national troops into Alabama was hailed with joy by numbers of the inhabitants. On May 30 it was discovered that Corinth had been evacuated, every thing of value being removed or destroyed. Gen. Pope was sent in pursuit; but the main body of the enemy, consisting of nearly all the available troops in the whole confederacy with the exception of the army concentrated about Richmond, made good its retreat, and appears to have been broken up into several detached bodies, of which we have not yet (Sept. 1) any certain information. The contest in the West was now confined to the Mississippi, where after the fall of Island No. Ten the confederates had made a stand at Fort Wright, about 50 m. above Memphis. Fire was opened upon this work by the gunboats and mortar vessels, April 18, but without much effect. On May 8 the federal flotilla, commanded by Capt. O. H. Davis (Flag Officer Foote having been disabled by a wound), was attacked here by 8 confederate gunboats, 4 of which were provided with rams. After a sharp conflict of an hour the confederates were driven off, losing 8 of their boats blown up and sunk. On the 31st it was discovered that the fort had been abandoned. The vessels then dropped down to Memphis, where the whole confederate fleet, consisting of 8 gunboats and steam rams, was awaiting its arrival. The federal flotilla had meanwhile been reinforced by 8 or 10 steam rams fitted out under authority from the war department by Col. Charles Ellet. The

fight took place June 6, and resulted after an hour and a half, owing in good part to the operations of the ram fleet, in the capture or destruction of 7 of the rebel boats, one escaping by superior speed. Memphis immediately surrendered. On the lower Mississippi a still more important success had been gained by the federal navy. As long ago as November Ship Island, near the mouth of the river, had been occupied and made a rendezvous for a military force under Gen. B. F. Butler, designed for the occupation of New Orleans. On April 16 a fleet of 45 vessels, carrying 280 guns and 21 mortars, and commanded by Flag Officer Farragut, the mortar boats being under the special command of Capt. David D. Porter, moved up the river to attack Forts Jackson and St. Philip, on opposite sides of the stream about 75 m. below the city. Both these works were of great strength, and between them a chain had been thrown across the river. The bombardment began on the 18th and lasted 6 days, when Flag Officer Farragut, having broken the chain, ran past the forts with 14 steamers and gunboats, destroyed a squadron of the enemy's rams and gunboats, silenced the batteries above the forts, and occupied New Orleans without further opposition on the 25th; Gen. Mansfield Lovell, in command of the confederate land troops, evacuating it on his arrival, and destroying all the cotton, sugar, and other valuable stores. Forts Jackson and St. Philip surrendered to Capt. Porter on the 28th. Gen. Butler now moved up with his army, took formal possession of New Orleans, and placed it under martial law. Farragut's fleet passed up the river, captured Baton Rouge, and afterward proceeded to Vicksburg, the only remaining stronghold of the confederates on the Mississippi. Here he passed the powerful batteries on shore, joined Flag Officer Davis's flotilla from Memphis, and a bombardment was opened upon the city, and continued till Aug. 1, when it was suspended to await the coöperation of land forces. On the peninsula between the York and James rivers McClellan had commenced the siege of Yorktown April 5, and the confederate army had gradually concentrated at Richmond. Gen. McDowell had moved upon Fredericksburg April 18, and Gen. Banks about the same time moved up the valley of the Shenandoah. On May 4 the confederate troops evacuated Yorktown and Gloucester Point, leaving 71 guns in their works, and retreated toward Richmond, McClellan pursuing them. They were overtaken the next day at Williamsburg, where a sharp action occurred; and on the 7th Gen. Franklin, who had been sent from Washington to reinforce McClellan, landed at West Point on the York river, and defeated a force under Gens. Whiting and G. W. Smith. On the 10th Norfolk was occupied without resistance by a detachment from Fortress Monroe under Gen. Wool, and the iron-plated vessel Merrimac was blown up to prevent it from falling into his hands. The Monitor and several other

vessels, including two new and formidable iron-clad gunboats, were sent up the James river to operate against Richmond, but met, with obstructions near Fort Darling, a few miles below the city, and were driven back with loss (May 15). The Monitor, though repeatedly struck, was uninjured, but could not elevate her guns enough to produce any impression on the fort, which was situated on a high bluff. Another check was experienced in the valley of the Shenandoah, where Gen. Banks, after penetrating 100 miles and driving the enemy beyond Harrisonburg, was ordered to send most of his troops to McDowell. While thus weakened, having barely 5,000 men left, he was attacked by 20,000 confederate troops under Gen. J. T. Jackson, and his advance, consisting of 900 men under Col. Kenley, was cut off at Front Royal, May 28. By a prompt retreat Banks saved the rest of his army and nearly all his baggage, retiring into Maryland, closely pursued by Jackson as far as the Potomac. This event caused the greatest alarm in Washington, it being at first supposed that the whole army from Richmond was about to cross into Maryland. The governors of Pennsylvania, New York, and the New England states were telegraphed to send on more troops, and several militia regiments immediately set out for Baltimore and the Potomac. Jackson however retreated as rapidly as he had advanced. Fremont, by forced marches across the mountains, endeavored to intercept him, but succeeded only in overtaking his rear guard and forcing a battle at Cross Keys, near Harrisonburg, June 8, in which Jackson was worsted. Another engagement took place the next day at Port Republic, on the Shenandoah, where Jackson attacked the advance of Gen. Shields's corps, and forced it to fall back upon the main body, when he was in turn repulsed. Gen. McClellan meanwhile slowly followed the confederate army up the Yorktown peninsula, until on May 20 he reached the Chickahominy, a small tributary of the James river, flowing through a swampy tract at a distance of from 6 to 15 m. from Richmond. Here a delay was caused by the necessity of constructing bridges and roads. Continual skirmishing occurred, and on the 27th a sharp engagement was fought at Hanover Court House, 16 m. N. of Richmond, where Gen. Fitz John Porter succeeded in cutting off communication with Richmond over the Fredericksburg railroad. Portions of the army had meanwhile crossed the Chickahominy, and by the end of the month the extreme advance was at Fair Oaks, 5 miles from Richmond; the extreme left was on or near James river; and the right extended to the White House, on the Pamunkey, one of the head streams of the York. It was here that the army had its depot of supplies. On the 31st the confederates, taking advantage of a flood in the Chickahominy, attacked the advance under Gen. Casey at Fair Oaks, and drove them back to the river with the loss of their guns and baggage. There

they were supported by the divisions of Hanzelman and Kearny, and enabled to maintain the contest till reinforcements were brought across by Sumner, when the confederates were repulsed and the ground that had been lost was recovered. The attack was renewed the next day, but the federal troops were everywhere victorious. Their loss was officially reported as 5,789 killed, wounded, and missing. The confederates were led by Gen. Joseph E. Johnston, who was wounded on the first day. No other battle of importance occurred until June 26, at which time 3 army corps had crossed the Chickahominy. The confederates had been heavily reinforced, and McClellan, convinced of the impossibility of defending his extended line with the force at his disposal, resolved to transfer his base of operations to the James river. The supplies were accordingly shipped at the White House, and the army prepared to move by the left flank. On the evening of the 26th the enemy under Jackson fell with overwhelming force upon McClellan's right wing at Beaver Dam, and, though driven back late at night, renewed the attack in heavier numbers the next morning. The federals under Fitz John Porter fell back to Gaines's hill, where a bloody contest was maintained until night, the main body of the army being at the same time engaged along its entire line. That night and the next day the whole army and its train were moving toward the James, Franklin with the 6th army corps being left to cover the retreat. Every step of the march was obstinately disputed. The passage of the White Oak swamp especially, June 30, was attended with great slaughter, being accomplished only after a battle which lasted all day. On July 1 the army reached the James river, and there they were again attacked at Malvern hills, but defeated their assailants more completely than in any previous engagement of the 6 days' fight. That night they marched to Harrison's Landing, a position of greater strength some distance below, and about 17 m. from Richmond, where they remained until Aug. 14, protected by a large fleet of gunboats. The federal loss during these 6 days was reported as 1,645 killed, 7,701 wounded, and 5,958 missing; total 15,224. The corps of Fremont, Banks, and McDowell were consolidated, June 26, into the "army of Virginia," and placed under the command of Major-Gen. Pope. In consequence of this appointment Gen. Fremont asked leave to retire from active service, and was replaced by Gen. Sigel. On July 1 the president called for 300,000 more volunteers to serve during the war. On the 11th Major-Gen. Halleck was appointed to the command of all the land forces of the United States as general-in-chief, Gen. Grant succeeding him in command of the army of the Mississippi. On June 16, Gen. Hunter, with all the available forces at Port Royal, made an unsuccessful demonstration upon James island near Charleston, where the enemy were intrenched at a place

called Secessionville. The federal troops, commanded by Gen. Benham, were repulsed after a fight of 5 hours, with a loss estimated at 700. On the 18th Gen. Morgan, of the U. S. volunteers, seized Cumberland Gap, the main gate of communication between Kentucky and eastern Tennessee. On the 11th the army under Gen. Curtis arrived safely at Helena, Ark., where it remained till about Aug. 12, when it moved upon Little Rock. Missouri, Kentucky, and Tennessee were now overrun by guerrilla bands, who inflicted great damage upon the Union inhabitants. Toward the latter part of July, the provisional governor of Missouri ordered a draft of the whole militia of the state to resist them. Murfreesborough, Tenn., was captured on July 13 by a force composed chiefly of guerrillas. On the 15th the confederate iron-clad ram Arkansas engaged a part of Flag Officer Davis's flotilla near the mouth of the Yazoo river, injured several of the vessels, and ran through the rest of the fleet to Vicksburg. On Aug. 4 she left Vicksburg to take part in a confederate attack on Baton Rouge, and on the 6th she was attacked near that place by the U. S. gunboat Essex, Commander W. D. Porter, and after an action of about 20 minutes she took fire and was blown up. At the same time the attack of the confederate land forces, some 10,000 strong, led by John C. Breckinridge, was repelled after a spirited action by the federal army, about 4,500 strong, under Brig. Gen. Thomas Williams, who fell in the action. The losses on both sides were heavy. On Aug. 9 a hotly contested battle was fought at Cedar Mountain, 8 m. S. of Culpepper Court House, Va., between a corps of Gen. Pope's army commanded by Gen. Banks, and a confederate army which had made a rapid advance from Richmond under command of Gen. Jackson. The attack of the confederates was unsuccessful, notwithstanding their superiority of numbers, and on the following day they retired in the direction of Richmond. The federal loss in this battle was about 1,500 killed, wounded, and prisoners. The first important measure of Gen. Halleck, in assuming the chief command of the federal armies, was to order the army of the Potomac to retreat from its position at Harrison's landing to Yorktown and Fortress Monroe, with a view to its transfer to the Rappahannock and its direct coöperation with the army of Virginia under Gen. Pope. This difficult and perilous movement was begun on Aug. 14. Gen. Fitz John Porter's corps leading the march and arriving at Newport News, its place of embarkation, on the 18th, without being disturbed by the enemy; the other corps accomplished the movement with equal success. Meanwhile, on Aug. 4, an order was issued by the president calling for an additional force of 300,000 men to serve for 9 months, to be raised by drafting. This order, instead of checking the popular enthusiasm, gave it an astonishing stimulus, under which the work of filling up the number of the 300,000 volunteers required

by the order of July 1 was prosecuted with remarkable energy; the western states especially declared themselves ready to raise more than their quotas, and now (Sept. 1) the whole levy of 300,000 is fully armed, equipped, and the greater part of these new forces are already in the field. A large portion of them have been sent to serve in the department of Ohio, created Aug. 19, comprising the states of Indiana, Ohio, and Kentucky, and including Cumberland Gap and the region about it in Tennessee, under the command of Maj. Gen. H. G. Wright.—The extra session of congress which began July 4, 1861, closed on Aug. 6. Its chief acts were for the providing of ways and means to carry on the war, and for this the duties on certain imports were increased, and a loan of \$250,000,000 was authorized, together with an issue of \$50,000,000 in treasury notes. The first regular session began Dec. 2, 1861, and ended July 17, 1862. Mr. Breckinridge, the late vice-president, who had appeared as a senator at the extra session, was expelled for treason in having openly embraced the confederate cause, as were also two members of the house of representatives. Bills were speedily passed for the construction of gunboats on the Mississippi, and of 20 iron-clad vessels of war. By the acts of this session the secretary of the treasury was authorized to issue \$150,000,000 more treasury notes, to negotiate \$500,000,000 of 6 per cent. bonds, to receive temporary deposits to the extent of \$100,000,000 at the rate of 4 per cent., and to issue to all creditors of the government certificates of indebtedness. A tax law levying a duty of 3 per cent. on the products of all kinds of labor and the net profits of every description of business was passed, as was also a tariff adding about 5 per cent. to previously established duties. Slavery was abolished in the district of Columbia, and prohibited in all the territories of the United States, present or to come. On the recommendation of President Lincoln, a resolution was passed offering to any state which will abolish slavery an indemnity sufficient to remunerate the slaveholders. The army was ordered to receive within its lines all fugitive slaves, and not to surrender them to their owners; and the president was authorized to employ the slaves in the military or naval service at his discretion, the slaves of all open rebels being declared free. An act confiscating all the property of rebels and emancipating their slaves completes the list of important anti-slavery measures effected by this congress. The supreme court was reorganized by apportioning the judicial circuits according to population, thus giving to the free states 6 of the 9 judges. A homestead act and a Pacific railroad act were also passed by this congress, which has perhaps encountered more serious responsibility, and undertaken and carried through a series of legislative measures of more consequence to the country, than any other congress since the foundation of the government.

TABLE I.—DATE OF ADMISSION OR ORGANIZATION, AREA, AND POPULATION OF THE STATES AND TERRITORIES, 1790-1900.

States and Territories.	Date.	Area in square miles.	Total population.

			Val. of home-made manufactures	\$37,462,844	\$94,000,000

* Cane and maple molasses are returned together in the census of 1880, and separately in that of 1890. The product of Delaware and Missouri in 1880 was all cane molasses; of that of North Carolina, 12,494 galls. was cane, and 17,529 maple; of Mississippi, 8,445 cane; of Louisiana, 66,470 maple; of Texas, 8,000 maple; and of Tennessee, 6,754 maple. In all other cases, the kind of molasses, with slight exceptions, corresponds with that of the sugar produced. The culture of sugar has been introduced since 1850.

‡ To June 30, on which day the fiscal year of the government has since closed.

UNITED STATES, LITERATURE OF THE. The literary history of the United States may be treated under three distinctly marked periods, viz.: a colonial or ante-revolutionary period (from 1620 to 1775), during which the literature of the country was closely assimilated in form and character to that of England; a first American period (from 1775 to 1820), which witnessed the transition from a style for the most part imitative to one national or peculiar, as a consequence of the revolutionary struggle and of the ideas generated by it; and a second American (from 1820 to the present time), in which the literature of the country assumed a decided character of originality, not yet fully developed.—I. 1620 to 1775. The first literary production of any note emanating from the British American colonies was the version of Ovid's "Metamorphoses" made by George Sandys on the banks of the James river about 1620, and published in London in 1626. But notwithstanding that men of letters were found everywhere among the early colonists, in New England alone, where in 1638 the first printing press was established in Cambridge, was any considerable progress in literary culture made, and the literature of the first or colonial period was chiefly confined to that locality or was indirectly connected with it. The earliest development, owing to the religious character of the people, to the causes which led to their emigration, and to the fact that during the first century after the settlement of the country the clergy were the best informed and educated class, was theological. The "Bay Psalm Book" (Cambridge, 1640), the first book printed in the country, though not strictly original, became very popular both in America and Great Britain, and within a little more than a century passed through not fewer than 70 editions in both hemispheres. In the same year appeared a volume of poems by Mrs. Anne Bradstreet (1612-'73), which was the first original work published in New England. The colonial press however speedily became monopolized by religious writers, and among its most remarkable succeeding productions were the Indian Bible of John Eliot (1604-'90), the first edition of the Scriptures published in America, and an extraordinary monument of patience and industry, though now of interest only to the antiquary; the "Concordance of the Scriptures," by John Newman, which was the earliest work of its kind, and the immediate precursor of Cruden's Concordance; and the prolific writings of Increase and Cotton Mather (1663-1728), the latter of whom was the author of no fewer than 388 works, of most of which not even the titles are remembered. The most celebrated are the "Wonders of the Invisible World" and the *Magnalia Christi Americana*, an ecclesiastical history of New England from 1620 to 1698, containing biographies of several colonial worthies. Cotton Mather creditably represented the colonies in respect to erudition, but his style is quaint and uncouth, and his name

is inseparably connected with the gloomy history of witchcraft in New England. To the early colonial times also belong John Cotton (1585-1652), one of the first ministers of Boston; Thomas Hooker (1586-1647); Roger Williams (1606-'88), the founder of Rhode Island; John Davenport (1598-1670), Charles Chauncy (1592-1672), and John Norton (1606-'63), eminent in their day as theological writers, but whose works are now but little known. The establishment of Harvard college in 1636, and of William and Mary and Yale colleges in the last decade of the 17th century, together with the practice, which became common with many of the wealthier colonists, of sending their sons to England to be educated, meanwhile showed its effects in the gradual improvement of style and in the more discursive aims of writers. But theology was still the department of letters most generally cultivated, and among theologians Jonathan Edwards (1703-'58), whose power of subtle argument Sir James Mackintosh declares to be "perhaps unmatched, certainly unsurpassed among men," was the first not only in America, but, according to Robert Hall, in "any country or age." His celebrated treatise on the "Freedom of the Will," originally undertaken to furnish a philosophical basis for the theological system of Calvin, to which the author was firmly attached, ranks among the standard authorities in English metaphysics; and his "Dissertation on the Nature of True Virtue," his controversial work on "Original Sin," his "Treatise concerning Religious Affections," and other works, though now comparatively little read, on account of the prolixity of their style and the prevailing distaste for writings of a profoundly reflective character, exhibit a force of thought and keenness of argument only displayed by the greatest minds. Other theologians of the colonial period were a second Charles Chauncy (1705-'87); John Witherspoon (1722-'94); James Blair (died in 1743), president of William and Mary college; Jonathan Mayhew (1720-'66), a vigorous opponent of episcopacy and a man of liberal political views; Samuel Johnson (1696-1772), the first president of Columbia college, and the father of the American Episcopal church; Samuel Cooper (1725-'88); Mather Byles (1706-'88), a loyalist during the revolution, now chiefly remembered for his humor; and Ezra Stiles (1727-'95), president of Yale college. John Woolman (1720-'72), a Quaker writer and preacher, whose "Journal" is highly commended by Charles Lamb, deserves mention as one of the first who wrote against slavery. The influence of the great English essayists and novelists of the 18th century had meanwhile begun to affect the literature of the new world; and in the essays, the collection of maxims published under the title of "Poor Richard" or "The Way to Wealth," the scientific papers, and the autobiography of Benjamin Franklin (1706-'90), we have specimens of practical philosophy or of

simple narrative, expressed in a style eminently clear, pleasing, and condensed, and not unfrequently embellished by the wit and elegance characteristic of the best writers of Queen Anne's time. His investigations in electricity and other scientific subjects are not less felicitously narrated, and, together with the works of James Logan (1674-1751), Paul Dudley (1675-1751), Cadwallader Colden (1688-1776), and John Bartram (1701-'77), a naturalist and one of the earliest of American travellers, constitute the chief contributions to scientific literature during the colonial period. The historians and annalists are less prominent than the theologians, and their writings if possible less known at the present day. The tracts and pamphlets relating to the discovery and colonization of British America, emanating from early settlers, are nevertheless exceedingly numerous; and the journals and annals of such men as Winthrop, Winslow, Morton, and others, though not strictly belonging to American literature, are worthy of note as the sources from which modern historical writers have derived much important information. William Hubbard (1691-1704) wrote the history of New England, which however was not published until more than a century after his death; and Thomas Prince (1687-1758), who devoted a great part of his life to collecting materials, commenced a more extensive work on the same subject, but which was never completed. Among the earlier contributions to American local history may be mentioned the history of Rhode Island by John Callender (1706-'48), that of the discovery and settlement of Virginia by William Stith (died in 1750), and that of Massachusetts by Thomas Hutchinson, its last colonial governor, a man of considerable learning and culture, but "blind except to facts, and without a glimpse of the great truths which were the mighty causes of the revolutions he describes." Of works relating to the Indians, the most noteworthy were the history of King Philip's war by the famous Captain Benjamin Church (1689-1718), the history of the Five Nations by Cadwallader Colden, and the "Diary" of the missionary David Brainerd (1718-'47). The poetry of this period has no pretension to literary merit, but the drama of "The Prince of Parthia," by Thomas Godfrey, a son of the inventor of the mariner's quadrant, deserves mention as the first work of the class produced in America.—II. 1775 to 1820. The earliest works produced during the first American period, commencing with the revolution, are naturally associated with the causes which led to that event; and the political pamphlets, speeches, letters, and other writings of the men who aided in securing the independence of the North American colonies afford the first indications of a desire to cast aside the conventionalisms of European literature, and to develop one characteristic of the country and its institutions. The severance of the intellectual reliance of the colonies upon

the mother country followed as a consequence of their political independence, and as early as the commencement of the revolutionary struggle the high literary ability as well as the practical wisdom evinced in the public documents of the principal American statesmen were recognized by Lord Chatham, in whose opinion these productions rivalled the masterpieces of antiquity. Politics now gained a prominence almost equal to that enjoyed by theology in the preceding period; and dry as such subjects usually are to the mass of readers, the discussion of them in speeches and pamphlets during the last quarter of the 18th century accorded thoroughly with the popular taste, and the influence of political writers and orators in giving a decided national type to American literature is unmistakable. Conspicuous among the early pamphleteers were James Otis (1735-'83), Josiah Quincy, jr. (1744-'75), John Dickinson (1732-1808), Joseph Galloway (1730-1808), a tory writer, Richard Henry Lee (1732-'94), Arthur Lee (1740-'92), William Livingston (1723-'90), William Henry Drayton (1749-'99), John Adams (1735-1826), Thomas Jefferson (1743-1826), and Timothy Pickens (1748-1829), of whom Otis and Quincy were perhaps most distinguished as orators, although little beyond the traditions of their eloquence has come down to us. For fervid declamation Patrick Henry (1736-'99) stands at the head of all the orators of this period; and in the reports of his speeches, meagre as they are, he has been more fortunate than others of his contemporaries, as Samuel Adams (1723-1803), John Rutledge (1739-1800), Edward Rutledge (1749-1800), Charles Cotesworth Pinckney (1746-1825), Gouverneur Morris (1732-1816), and George Mason (1726-'92), whose reputation as parliamentary debaters or public speakers was very high, and whose impassioned eloquence is described as having "moved the hearers from their seats." These men may be considered the founders of the present school of American oratory. The "Common Sense" of Thomas Paine (1737-1809), though not strictly the work of an American author, may be classed among the early national literature, from the fact that it was thoroughly American in tone, and was inspired by the causes which produced the revolution. The great state paper of this era, and perhaps the most remarkable ever produced, was the "Declaration of Independence," by Thomas Jefferson, who desired that his title to the authorship might be engrained on his monument. For the concise and direct manner in which the grounds of complaint against the mother country are stated, for dignity and eloquence, and for the influence which it has exerted and the reverence with which it is still regarded, it may be considered unrivalled among works of its class. Jefferson also published a "Summary View of the Rights of British America," and a volume entitled "Notes on Virginia," which passed through many editions in Europe and America, and left a mass of cor-

responsiveness forming a valuable contribution to American political history. The writings of George Washington (1732-'99), produced in great part amid the excitements and harassments of military life, must always hold a distinguished place in American literature, not only on account of the lofty patriotism by which they are inspired, and of their solid common sense, but of their clearness of expression and force of language—a characteristic, indeed, of most of the writers who were contemporary with him. Alexander Hamilton (1757-1804), by turns soldier, lawyer, and statesman, and eminent in each walk, was a member of the convention which framed the federal constitution; and according to Guizot there is not "one element of order, strength, or durability" in that instrument which he did not powerfully contribute to introduce. An enduring monument of his political sagacity and literary ability is the "Federalist," a series of papers written chiefly by himself for the purpose of elucidating and supporting the principles of the new constitution, and which is said by the "Edinburgh Review" to exhibit "an extent and precision of information, a profundity of research, and an acuteness of understanding, which would have done honor to the most illustrious statesmen of ancient or modern times." Hamilton was assisted in this work by John Jay (1745-1829), the first chief justice of the United States, and James Madison (1751-1836), the fourth president, of whom the former was the author of an "Address to the People of Great Britain" issued by congress in 1774, and other political papers, and the latter a prolific writer on political, constitutional, and historical subjects. John Adams, who wrote with eminent perspicuity and elegance, published a "Defence of the American Constitution," and a series of "Discourses on Davila," directed against the French revolutionary ideas prevalent in the last decade of the 18th century, of which Jefferson was one of the ablest advocates, and left numerous political papers and letters, which, together with his "Diary," commenced in 1755, have been edited by his grandson Charles Francis Adams. The most accomplished rhetorician and speaker of the period was Fisher Ames (1758-1808), whose essays and orations are distinguished by a splendor of diction which often wearies the mind, notwithstanding the felicity and appositeness of the metaphors and illustrations employed. His reputation, owing to the temporary interest of many of the subjects on which he wrote and spoke, has very considerably declined.—The historians and biographers of this period creditably illustrate the growing literature of the country, and several of their productions are still regarded as standard authorities. Among special local histories may be mentioned those of New Hampshire by Jeremy Belknap (1744-'98), whose series of "American Biographical Sketches" were the precursors of the valuable works of Sparks;

of Connecticut by Benjamin Trumbull (1735-1820); of Massachusetts by George R. Minot (1758-1802), being a continuation of that by Hutchinson; of Vermont by Samuel Williams (1761-1818); and of Pennsylvania by Robert Proud (1728-1818). Of more general interest are the histories of New England by Hannah Adams (1756-1832) and of the American revolution by William Gordon (1780-1807), an English clergyman long settled in America, and David Ramsay (1749-1815), who also wrote a history of South Carolina, a life of Washington, and other works, evincing much research and a conscientious spirit of inquiry. The "Annals of America," by Abiel Holmes (1763-1837), has for more than half a century been considered a leading authority in American history. The most important biography produced during this period is the "Life of Washington" by Chief Justice Marshall (1755-1835), whose literary labors however are overshadowed in importance by his judicial celebrity. William Wirt (1772-1834), an accomplished forensic orator, produced an admirable "Life of Patrick Henry," and also a series of papers entitled "Letters of the British Spy," written with much elegance and force of style; and the "Military Journal" of James Thacher (1754-1844), and "Memoirs" of Alexander Graydon (1752-1818), both officers in the American revolutionary army, contain many interesting and trustworthy accounts of the men and times which they illustrate. The "Letters from an American Farmer," by Hector St. John Crèvecoeur (1781-1818), also afford pleasing pictures of social life in America. Of works of travel, the most important are the narrative of Jonathan Carver (1732-'80), one of the first who penetrated west of the Mississippi valley; the journals of the intrepid John Ledyard (1751-'89); the reports of Major Zebulon Montgomery Pike (1779-1818), the earliest American explorer of the sources of the Mississippi and the Rio Grande; and the account of the expedition of Lewis and Clark across the Rocky mountains to the mouth of the Columbia river, prepared by Nicholas Biddle and Paul Allen.—The theologians of this period are ably represented by Jonathan Edwards (1745-1801), son of the great metaphysician of the same name, and the author of a profound "Dissertation on Liberty and Necessity," and of a treatise entitled "The Salvation of all Men Examined and Explained;" Samuel Hopkins (1721-1808), whose "System of Theology" presents a reflex of the progress of religious opinions in New England; Timothy Dwight (1729-1817), president of Yale college, whose principal work, "Theology Explained and Defended," maintains moderate Calvinistic views with much dignity and eloquence, and has been extensively circulated in England and America; and Bishop William White (1747-1836), the earliest historian of the Protestant Episcopal church in America. Other eminent divines and authors were Joseph Bellamy (1719-'90), John Smalley (1784-1820), Nathaniel Emmons (1745-1840),

John Mitchell Mason (1770-1829), Noah Worcester (1758-1838), Samuel Worcester (1771-1821), Edward Payson (1783-1827), Bishops John Henry Hobart (1775-1830) and Theodore Dehon (1776-1817), and John Murray (1741-1815), the father of Universalism in America. Prominent among the younger divines was Joseph Stevens Buckminster (1784-1812), one of the earliest of the New England Unitarians, and whose published sermons, remarkable for purity of thought and finish of style, justify the expectations which his untimely death dispelled. At this period, in addition to purely theological subjects, the clergy were in the habit of discussing those of public interest; whence it frequently happened that discourses from the pulpit had almost as decided a political bias as the set speeches of the party orators—a practice which the subsequent wide diffusion of newspapers tended to check.—One of the first and most useful laborers in the field of science was David Rittenhouse (1732-'96), a great and self-educated genius, whose memoirs on astronomy and mathematics were published in the first 4 volumes of the "Transactions" of the philosophical society of Philadelphia. Benjamin Rush (1745-1813) and James McClurg (1747-1825) were conspicuous as writers on medical science, the work of the former on the "Diseases of the Mind" being still a standard authority; and Benjamin Smith Barton (1766-1815), a naturalist, produced the first American elementary work on botany, and the first contribution to the ethnographical literature of the country. The most important contribution to natural history was Alexander Wilson's "Description of the Birds of North America," a work still held in much repute. Samuel Latham Mitchell (1764-1831) was one of the earliest writers on chemistry. To these names may be added those of Lindley Murray (1745-1826), author of the treatise entitled the "Power of Religion over the Mind," and of the well known "English Grammar," bearing his name, and the eminent physicist Benjamin Thompson, Count Rumford (1753-1814), both of whom were by birth and education Americans.—The most distinguished poet of this period, whether we consider the variety and literary merit of his compositions or their popularity, was Philip Freneau (1752-1832), many of whose productions, inspired by the revolutionary spirit, display vigor of language and considerable imaginative power. Some of his smaller pieces preserve their popularity to the present day, and such writers as Campbell have not scrupled to borrow whole passages from them. Contemporary with him were John Trumbull (1750-1831), author of a once popular poem in the Hudibrastic style entitled "McFingal," in which the tories and other enemies to American liberty are satirized, and which presents a remarkably vivid picture of contemporary manners and opinions; Joel Barlow (1755-1812), who wrote a heavy epic entitled the "Columbiad," which was original-

ly well received, and reprinted in London and Paris, and a humorous mock-heroic poem: praise of "Hasty Pudding;" Lemuel Hopkins (1750-1801), author of a satirical poem called the "Anarchiad;" and Timothy Dwight, a theologian, whose "Conquest of Canaan," an epic, and other poems, are smoothly versified, and exercised a considerable influence upon contemporary writers. William Clifton (1772-'93) wrote a few songs equal to any poetry which had previously appeared in America; and Thomas Green Fessenden (1771-1837) produced in London a very successful satire on the physicians who opposed the metallic tractors of Perkins, entitled "The Terrible Tractoration." Among the other poets of the period were David Humphreys (1753-1815), Joseph Hopkinson (1770-1842), author of the well known national lyric "Hail Columbia," and Robert Treat Paine, jr. (1773-1811), whose "Adams and Liberty" was once a rallying song of the federalists. The style adopted by these writers was essentially that prevalent in England during the latter half of the 18th century; nor was any innovation upon established models, whether in form or expression, attempted, in American poetry until after the commencement of the third and last period of the national literature.—Charles Brockden Brown (1771-1810), the first American novelist, was also the first author who made a profession of literature; and his best productions, "Wieland, or the Transformation," "Arthur Mervyn," and "Edgar Huntley," have much graphic power and are good specimens of the Godwin school of fiction. He was a man of feeble physical constitution, a rapid and often careless writer, and has been described as "a gentle, unobtrusive enthusiast, whose weak frame was shattered and wrecked by the too powerful pulsations of his heart."—Of the miscellaneous writers of the period, whose productions appeared mostly in the newspapers and magazines, the chief were Francis Hopkinson (1737-'91), eminent as a humorous writer in prose and verse; Hugh Henry Brackenridge (1748-1816), author of a vigorous satire entitled "Modern Chivalry;" Joseph Dennie (1768-1812), one of the earliest American magazine writers and editors, who published a well known series of essays under the title of "The Lay Preacher;" David Everett (1769-1813), Isaac Story (1774-1803), Royall Tyler (1756-1826), and Paul Allen (1775-1826).—III. 1820 to 1862. The last period in American literature presents a marked contrast to those which preceded in the national character, as well as in the variety and extent of its productions. It was in 1820 that the poverty of American literature was sneeringly commented upon by Sydney Smith in an article in the "Edinburgh Review;" and from that date the intellectual development of the country, the political crisis which attended the establishment of the government being past, has been commensurate with its social and material progress, until at the present day there may be said to be no

Department of human knowledge which has not been more or less thoroughly explored by American authors. In history, in jurisprudence, and in certain departments of natural science and imaginative literature, their efforts during the last 40 years have been exceeded by those of no contemporary authors in any part of the world. In the two former periods Europe, and particularly the mother country, was recognized as the chief source of mental supplies; a circumstance to be attributed in part to the obstacles to literary culture which a colonial condition necessarily imposes, in part to the facility with which the abundant literature of the old world may be appropriated by the new, and very considerably also to a want of self-reliance in native authors, and an indifference to the value of native material; but so rapid has been the intellectual development of the nation since that time, that America is now able to reciprocate in kind the benefits she so long exclusively enjoyed. It may be also generally remarked, that within this period the style and tone of the national literature have begun to partake more decidedly of the national character, although in certain departments only, particularly in that of imaginative writing, has any decided originality been shown. How far this originality has approximated to a permanent form it is not now possible to determine, but of its existence and rapid growth there can be no question.—While in the periods already treated of, the labors of American historians were for the most part confined to the collection of materials or to the unadorned record of facts, their successors have taken a wider range of subjects, and infused a more philosophical spirit into their writings; and although, among the many hundred historical works already produced, few rise above the dignity of local narratives or compilations of materials, as storehouses of data they have been ably employed by those who can analyze the significance of past events, and connect them by analogy with the tendency of the present. Prominent among these is George Bancroft, whose "History of the United States," a work still in progress, has been pronounced "the most successful attempt yet made to reduce the chaotic but rich materials of American history to order, beauty, and moral significance." It is characterized by an earnest sympathy with democratic institutions, by a generous enthusiasm for the martyrs of freedom and civilization, by patient research and discrimination in the choice of authorities, and by a style animated and genial throughout, although in occasional passages, perhaps, a little too labored. As the most complete and philosophic history of America yet written, it is destined to occupy an important place in the literature of the 19th century. The same subject has been ably treated by Richard Hildreth, whose work, bringing the narrative down to the year 1821, though written with no special attempt at rhetorical grace or picturesque effect, is valuable for its

impartiality and general accuracy, and has become a standard book of reference. Many school histories of the United States have been written, of which those by Salma Hale, S. G. Goodrich ("Peter Parley," 1793-1860), Samuel Eliot, Emma Willard, B. J. Lossing, Marcus Willson, and G. P. Quackenbos may be cited. Intermediate between the latter and the larger histories is the compendious work of J. H. Patton, bringing the narrative down to a very recent date. Among works illustrating particular periods or passages in the general history of the country may be mentioned the "Pictorial Field Book of the Revolution," by Benson J. Lossing, an industrious and careful writer; the "History of the United States Navy," by James Fenimore Cooper; histories of the war of 1812 by O. J. Ingersoll (1782-1862) and Lossing; the "American Archives" and other works by Peter Force; and numerous minor productions by W. L. Stone (1792-1844), John Armstrong, W. H. Trescott, Brantz Mayer, Winthrop Sargent, Richard Frothingham, jr., J. T. Headley, J. Sprague, Frank Moore, and others. The list of local histories, whether of single states or groups of states, or of special territorial districts, or of institutions, presents many works of merit. At the head of these perhaps stands the "History of New England" by J. G. Palfrey (born 1796), of which two volumes, embracing the events previous to 1667, have been published. The subject is treated with more fulness than in the work of Bancroft, and in a style of singular purity and finish. To this class belong the valuable "Geography and History of the Mississippi Valley" by Timothy Flint (1780-1840), the "History of the Discovery and Exploration of the Mississippi" and other works by John Gilmary Shea, the history of New England by C. W. Elliott, those of the "New Netherlands" by E. B. O'Callaghan, of New York by John Romeyn Brodhead, of Connecticut by Theodore Dwight and by G. H. Hollister, of North Carolina by F. L. Hawks, of Kentucky by Mann Butler, of Louisiana by Charles Gayarré and by F. X. Martin, of Oregon and the north-west coast of North America by Robert Greenhow, of South Carolina by W. G. Simms, of Texas by H. Yoakum, of Rhode Island by S. G. Arnold, of Virginia by Charles Campbell, and of Western Massachusetts by J. G. Holland. Of the numerous minor works of this class, the elaborate history of Boston by S. G. Drake, and of Westchester county, N. Y., by Robert Bolton, and that of Harvard university by Josiah Quincy, may be cited as examples. The history of the aboriginal tribes has been ably treated by S. G. Drake, whose "Book of the Indians of North America," though written in an unambitious style, was the first attempt at an impartial narrative of the subject, and is a valuable repository of facts; by T. L. McKenney and James Hall, who published a costly illustrated "History of the Indian Tribes of North America;" by George Catlin; by W. L. Stone; and espe-

cially by Henry Rowe Schoolcraft, whose works, although they come perhaps more naturally within the departments of travels and ethnography, evince a more intimate acquaintance with the history, languages, and customs of the North American aborigines than any others yet published. Of his elaborate "Historical and Statistical Information respecting the History, Condition, and Prospects of the Indian Tribes of the United States," the most considerable work of the class yet undertaken, 6 vols. 4to. have appeared. The "History of the Conspiracy of Pontiac," by Francis Parkman, narrates in an animated style an interesting episode in colonial history, and is one of the most valuable recent contributions to the history of the North American Indians. The works relating directly or indirectly to the history of the United States include O. W. Upham's account of the Salem witchcraft in 1692, R. S. Ripley's "War with Mexico," E. D. Mansfield's "Mexican War," G. W. Kendall's "Santa Fé Expedition," and Theodore Irving's "Conquest of Florida." Among American authors whose labors have been prosecuted beyond the limits of local or domestic history, no name stands higher than that of William Hickling Prescott (1796-1859), the historian of the Spanish conquest and civilization in the new world, and one of the most graceful and natural writers of the English language. His histories of the reigns of Ferdinand and Isabella and Philip II. of Spain, and of the "Conquest of Mexico" and the "Conquest of Peru," and his continuation of Robertson's "History of Charles V.," though produced under serious disabilities, the chief of which was an almost total blindness, exhibit an astonishing depth and accuracy of research, and, as one of the most eminent of his contemporaries has observed, "an impartiality and soundness of judgment, which give authority to every statement, and weight to every conclusion." The style is at the same time so lucid and attractive, as frequently to invest the narrative with the charm of fiction—a circumstance which has greatly contributed to render Prescott in both hemispheres one of the most popular of modern historians. As Prescott was the first to treat adequately the brilliant period of Spanish ascendancy, so the revolt of the Spanish provinces of the Netherlands has afforded a congenial subject to John Lothrop Motley (born 1814), whose "Rise of the Dutch Republic" and "History of the United Netherlands," the latter a continuation of the former, display extensive research, and are written with animation, and occasionally with great picturesque beauty of style. The author's instincts are strongly enlisted on the side of political and religious freedom, but without detracting from the impartiality of the narrative, and the work has taken its place among the great histories of the time, and been translated into the principal languages of Europe. Among other writers of foreign history may be mentioned Henry Wheaton, author of a "His-

tory of the Northmen;" Archibald Alexander, author of a "History of the Colonization of the West Coast of Africa;" Brantz Mayer, J. R. Poinsett, and R. A. Wilson, who have written on Mexico; Parke Godwin, who has published the first volume of an elaborate "History of France;" D. O. Allen, A. L. Koeppen, J. J. Jarves, Edmund Flagg, W. H. Stiles, and G. W. Greene. Many excellent works in the department of ecclesiastical or religious history have also been produced, prominent among which are the "Annals of the American Pulpit," by W. B. Sprague; the "History of the Presbyterian Church," by Charles Hodge; the "History of the Apostolic Church," by Philip Schaff; the "Progress of Religious Ideas," by Mrs. Lydia Maria Child; the "History of Methodism," by Abel Stevens; the "Modern History of Universalism," by Thomas Whittemore; the "Post-Biblical History of the Jews," by M. J. Raphall; the "Ecclesiastical History of New England," by J. B. Felt; the contributions to the history of the Protestant Episcopal church in Virginia, by Bishop William Meade and F. L. Hawks; the "History of the Baptist Denomination," by D. Benedict; the history of the "English Bible," by Mrs. H. C. Conant; and various works by Archibald Alexander, James Murdock, S. F. Jarvis, Robert Baird, Thomas Gaillard, W. Ingraham Kip, John Dowling, J. A. Spencer, and many others. To the department of literary history, the most important contributions are the "History of Spanish Literature," by George Ticknor, which is universally esteemed the best work on the subject extant; the several works of E. W. Griswold on the "Prose Writers," the "Poets," and the "Female Poets" of America; Caroline May's "American Female Poets;" J. S. Hart's "Female Poets of America;" O. D. Cleveland's compendiums of English, American, and classical literature; W. I. Coggeshall's "Poets and Poetry of the West;" T. Buchanan Read's "Female Poets of America;" and Mrs. A. C. L. Botts's "Handbook of Universal Literature." The "Cyclopædia of American Literature," by E. A. and G. L. Duyckinck, is the only comprehensive work on the subject yet published; and the "Critical Dictionary of English Literature," by S. Austin Allibone, of which the first volume has appeared, will form a valuable epitome of the literary history of England and the United States. Among miscellaneous works, the most important is the "History of Liberty," by Samuel Eliot, the completed portion of which, covering the history of the ancient Romans and the early Christians, and the struggle for constitutional liberty in Spain in the 16th century, is written with ability and in a philosophic spirit.—The first in point of date and reputation among the writers of biography of this period is Washington Irving (1783-1859), whose narratives of the "Life and Voyages of Christopher Columbus," and of the "Voyages and Discoveries of the Companions of Columbus," though not the most characteristic of his

writings, constitute a permanent contribution to English and American literature. Of more immediate and general interest is his "Life of George Washington," completed a few months before the author's death, and which perhaps has been more generally read in America than any other of his works. The narrative, embracing necessarily the main incidents of the revolutionary struggle, is related with such vivacity and picturesque beauty of language, that it is difficult to conceive how it can ever be superseded in popular use. His lives of Mahomet and Goldsmith are pleasing compilations, having little claim to originality. Among the most industrious laborers in the field of American biography is Jared Sparks (born 1789), who has devoted the greater part of his life to studies illustrative of the history of his country, and whose works, written in a sober and correct style, display remarkable fidelity and diligence of research. The "Library of American Biography," in two series and 25 volumes, edited by him, and to which he contributed lives of John Ledyard, Benedict Arnold, Ethan Allen, Charles Lee, Father Marquette, and others, is enriched by contributions from some of the best writers in the country, and is highly creditable to the national literature. Mr. Sparks has also edited the writings of Washington and Franklin, with lives of each, the diplomatic correspondence of the revolution, and the correspondence of public men with Washington—the whole constituting a rich fund of national material. Of the many biographies of public men produced during this period, the most prominent are those of Josiah Quincy, jr., by his son Josiah Quincy, of Elbridge Gerry by J. T. Austin, of James Otis by William Tudor, of Joseph Reed by his grandson W. B. Reed, of William Wirt by John P. Kennedy, of Thomas Jefferson by George Tucker and by H. S. Randall, of John Adams by his grandson Charles Francis Adams, of Joseph Story by his son W. W. Story, of Alexander Hamilton by his son J. O. Hamilton, of Henry Clay by Calvin Colton and of Aaron Burr and Andrew Jackson by James Parton, some of which have obtained a wide popularity. Among special biographies of American subjects may be mentioned the "Life of William Ellery Channing," by his nephew William Henry Channing; the "Memoirs of Margaret Fuller Ossoli," by W. H. Channing, Ralph Waldo Emerson, and James Freeman Clarke; the "Life of Daniel Boone," by Timothy Flint; a "Life of Washington," by Mrs. C. M. Kirkland; lives of Marion, Greene, and Captain John Smith, by W. G. Simms; the lives of the Indian chiefs Joseph Brant and Red Jacket, by W. L. Stone; the life of Bishop A. W. Griswold, by J. S. Stone; "Memoir of Rev. Dr. Buckminster and Joseph Stevens Buckminster," by Mrs. Eliza Buckminster Lee; the "Life of Theophilus Parsons," by his son Theophilus Parsons; "Memoirs of Nathaniel Emmons," by E. A. Park; the "Life of Washington Irving,"

by his nephew Pierre M. Irving, of which the first two volumes have appeared; beside many biographical sketches by Alexander Slidell Mackenzie, G. E. Ellis, Edward and Alexander H. Everett, H. A. Garland, C. O. Felton, C. W. Upham, Henry Wheaton, W. H. Prescott, Henry Reed, G. S. Hillard, W. Gammell, J. T. Headley, John Sanderson, R. T. Conrad, O. A. Goodrich, M. L. Davis, Alden Bradford, S. L. Knapp, N. Biddle, Epes Sargent, B. J. Lossing, G. L. Duyckinck, George H. Moore, Mrs. E. T. Ellet, and others. To this class also belong such works as the "Lives of American Loyalists," by Lorenzo Sabine, the "Personal Memoirs" of Joseph T. Buckingham, the "Reminiscences" of Bishop Philander Chase, and the "Ten Years of Preacher Life" and other works of William Henry Milburn. The contributors to miscellaneous and foreign biography comprise J. S. O. Abbott, author of a "Life of Napoleon," conceived in an unusually intense admiration of his subject, R. W. Griswold, H. W. Herbert, Samuel Osgood, J. Milton Mackie, Hannah F. Lee, X. Donald McLeod, Alfred Lee, Richard Hildreth, F. L. Hawks, Bishop J. R. Bayley, R. H. Wilde, and many others. Female biography has been comprehensively related by Mrs. S. J. Hale in her "Woman's Record," a sketch of distinguished women in all times. The principal general biographical dictionaries are those of William Allen, devoted to American subjects, and J. L. Blake; beside which a "Dictionary of Painters, Sculptors, and Engravers" has been published by S. Spooner, and a "Cyclopædia of Music" by J. W. Moore.—Washington Irving, though not exclusively a writer of prose fiction, was the first American whose fame in this department extended beyond the limits of his native country; and his "Sketch Book," "Knickerbocker's History of New York," "Bracebridge Hall," and "Tales of a Traveller," first introduced to a European public between 1820 and 1830, attracted immediate attention by their imaginative power, by their fine pathos and humor, and by the singularly pure and graceful style in which they were expressed. Though in many respects they might be taken for the productions of an author trained among the influences of an older civilization and accustomed to its literary amenities, the stories founded upon American subjects, of which the "Legend of Sleepy Hollow" may be cited as an example, are too national in feeling and in local character and color to admit of a doubt as to their origin, and will always constitute a delightful and indispensable part of American literature. James Fenimore Cooper (1789–1851) has the credit of giving the first decided impulse to romantic fiction in the new world, and through his works American literature became first generally known abroad. His "Spy," his nautical tales, including "The Pilot" and "The Red Rover," which, according to the "Edinburgh Review," gave him "the empire of the sea," and above all his series of Indian stories, abounding in lively pictures of

forest life, by their freshness, power, and novelty, took a strong hold upon the popular mind in both hemispheres; and some of them, including "The Spy" and "The Last of the Mohicans," have probably been translated into more languages than any other works of fiction. As a novelist, he was deficient in some of the chief requisites of his calling; but his faculty of description, and quick appreciation of what was tangible and characteristic in his native land, enabled him to obtain a success unsurpassed perhaps by any contemporary novelist, and which has been described as "a rich and legitimate fruit of American genius." The success of Cooper gave to the novel of adventure and backwoods life, or that founded upon colonial and revolutionary incidents, a popularity which caused it for a long time to be the chief form of fiction cultivated; and among many meritorious works of this class may be mentioned "The Dutchman's Fireside" and "Westward Ho" of James Kirke Paulding (1779-1860), a vigorous and successful writer; "Rob of the Bowl," "Swallow Barn," and "Horse Shoe Robinson," by James Pendleton Kennedy (born 1795); "Redwood," "Hope Leslie," "The Linwoods," and other pleasing pictures of early American life, by Miss C. M. Sedgwick; "The Partisan," "Mellichampe," "The Yemassee," "Guy Rivers," and numerous other tales by W. G. Simms (born 1806), one of the most dramatic and prolific of American authors, and who has drawn largely from the legendary history of the southern states for his materials; "Hobomok" and "The Rebels," by Mrs. L. M. Child (born 1802); "Seventy-Six" and other works by John Neal; "A New Home," by Mrs. C. M. Kirkland; the border tales of Dr. Robert Bird (1808-'54); and works by Timothy Flint (1780-1840), James Hall (born 1793), C. F. Hoffman (born 1806), T. B. Thorpe, C. W. Weber, and others. For finish of style, delicacy of psychological insight, and power in delineating the darker features of life and the emotions of guilt and pain, Nathaniel Hawthorne (born 1804) holds a peculiar place among American novelists. Writing on national subjects, and delighting especially in the gloomy passages of New England colonial history, he has employed fiction less for the purpose of illustrating practical life or of adding to the creations of the imaginative world, than of solving psychological problems. His "Scarlet Letter" and "House of the Seven Gables" were preceded by a variety of fancy sketches and historical narratives, published under the titles of "Twice-Told Tales" and "Mosses from an Old Manse," which in point of style and subtle analysis of character are among the most exquisite of the minor productions of American literature. The "Blithedale Romance," the next in the order of his novels, is marked by similar characteristics; and the "Marble Faun," the most elaborate and powerfully drawn of all his works, contains in addition pictures of Italian life and scenery of unsurpassed beauty. The "Tales

of the Grotesque and Arabesque," and other fictions, by Edgar Allan Poe (1811-'49), exhibit extraordinary metaphysical acuteness and a wild and gloomy imagination; but his analytical power, unlike that of Hawthorne, is seldom pervaded by any moral sentiment, and his finest creations, though they are elaborated with skill, have little human interest. N. P. Willis (born 1807) has obtained a unique reputation as a delineator of the lights and shadows which flit over the surface of society, and his style, remarkable for its felicity, not to say happy audacity of expression, is in accord with his subjects. His prose writings, though including many tales, belong perhaps more properly to the departments of travels and belles-lettres. As pictures of domestic life among the ancients, the "Zenobia," "Probus," and "Julian" of William Ware (1797-1852) are not surpassed by any similar productions in English literature. To this class also belong "Philothea," a tale of Athens in the days of Pericles, by Mrs. Child, and "The Roman Traitor," by Henry William Herbert (1807-'53), a successful contributor to many departments of literature, and well known under the pseudonym of "Frank Forester." For invention and graphic power Herman Melville's tales of ocean adventure, including "Typee" and "Omoo," stand perhaps at the head of their class in American literature, and have been widely read and admired abroad. The "Berber" and "Kaloolah" of W. S. Mayo, and the lively sketches of Lieut. H. A. Wise (Harry Gringo), are successful attempts in the same field. The most popular novel of the present century was the "Uncle Tom's Cabin" of Mrs. Harriet Beecher Stowe, an anti-slavery fiction, which has circulated by millions of copies in many languages, and deeply moved the public heart in Europe and America, not more on account of the moral of the story than of its pathos, its dramatic fervor, its delightful humor, and its inimitable pictures of negro life. "Dred," her second anti-slavery romance, is perhaps a work of more power than its predecessor, although less popular; and among her subsequent productions are the "Minister's Wooing," remarkable for its pictures of social and religious life in New England during the last century, the "Pearl of Orr's Island," and "Agnes of Sorrento." Of other novels founded upon the slavery question, the "White Slave," by Richard Hildreth, and "Ida May," by Mary Langdon (Mrs. Pike), may be cited as examples; and the "Partisan Leader," by Beverly Tucker, published originally many years ago, has recently attracted attention from its political significance, in connection with the war against the federal union. Of prose fictions by authors who have won distinction principally in other walks of literature, the most deserving of notice are "Monaldi," by Washington Allston (1779-1845); "Paul Felton" and other tales published by R. H. Dana (born 1787) in the "Idle Man," a serial edited by himself; "Hyperion," a

series of charming pictures of scenery and manners in Europe, connected by a thread of story, and "Kavanagh," by H. W. Longfellow (born 1807); "Leaves from Margaret Smith's Journal," by J. G. Whittier (born 1808), and "Elsie Venner," by Oliver Wendell Holmes (born 1809). The humorous writers are represented by Seba Smith, author of the well known letters of "Major Jack Downing," Cornelius Mathews, J. O. Neal (1807-'48), R. O. Sands (1799-1832), W. G. Clark (1810-'41), G. H. Derby, F. S. Cozzens, G. D. Prentice, and O. F. Briggs; beside Irving, whose "Knickerbocker's History of New York" is perhaps the most elaborate piece of humor in the national literature; Paulding, who in conjunction with Irving produced the "Salmagundi;" and some others mentioned above. Holmes possesses a copious vein of original humor, which however appears to the best advantage in his poems and miscellaneous prose writings. The list of American humorous writings would be incomplete without an allusion to that class of grotesque tales of which the "Big Bear of Arkansas" and the "Quarter Race in Kentucky," by T. B. Thorpe, afford characteristic specimens. Among other writers of prose fiction may be enumerated Sylvester Judd (1813-'53), author of "Margaret," a tragic tale of New England life, and "Richard Edney;" T. S. Fay, G. P. Thompson, Brantz Mayer, T. S. Arthur, J. V. Huntington, J. T. Trowbridge, L. M. Sargent, F. W. Shelton, George Wood, J. H. Ingraham, P. P. Cooke, J. E. Cooke, J. G. Holland, R. B. Kimball, C. G. Leland, X. Donald McLeod, G. W. Curtis, A. S. Roe, H. P. Myers, J. B. Cobb, and Robert T. S. Lowell. The female writers of fiction of this period constitute a numerous and important body, and the works of some of them are not exceeded in popularity by any contemporary writings of their class. It will suffice to mention, in addition to works already referred to, the several series of "Pencil Sketches," by Miss Eliza Leslie (1787-1867); the "Three Experiments of Living," by Mrs. H. F. Lee; "The Wide, Wide World" and "Queechy," by Miss Susan Warner; "Ruth Hall," "Fern Leaves," and other popular productions, by Mrs. S. P. W. Parton (Fanny Fern); "The Household of Bouverie," by Mrs. C. A. Warfield; "Naomi," by Mrs. E. B. Lee; "Charms and Counter-Charms," by Miss M. J. Mackintosh; beside numerous volumes by Mrs. Hale, Mrs. E. O. Embury, Mrs. O. L. Hentz, Mrs. A. S. Stephens, Mrs. E. Oakes Smith, Mrs. Ellet, Mrs. A. O. (Mowatt) Ritchie, Mrs. E. D. E. N. Southworth, Miss A. B. Warner, Mrs. E. S. Phelps (Trusta), Mrs. Alice Bradley (Neal) Haven, Miss Alice Carey, Miss Caroline Chesebro, Mrs. E. Robinson (Talvi), Miss Maria Cumming, Miss H. E. Prescott, Mrs. Virginia Terhune (Marion Harlan), Miss A. J. Evans, Mrs. M. J. Holmes, Mrs. M. H. Eastman, Mrs. Elizabeth Stoddard, Mrs. M. A. Sadlier, Mrs. M. A. Denison, Mrs. M. O. Lawrence, Mrs. M. E. Hewitt (Stebbing), and many others.—In intimate connection with the departments

already treated is that of juvenile literature, to which several authors have exclusively devoted themselves, and among the contributors to which are many of those previously mentioned. The first place undoubtedly belongs to S. G. Goodrich, whose numerous little books for the instruction or edification of children, published under the pseudonyme of "Peter Parley," have had a prodigious circulation in Europe as well as America. Nathaniel Hawthorne has written some delightful tales for children; Jacob Abbott (born 1808) is the author of the popular "Rollo," "Lucy," "Franconia," and other series of stories, and of numerous juvenile histories; and W. M. Simonds, John Bonner, F. O. Woodworth, George Taylor, Charles Nordhoff, Mrs. E. C. Judson (Fanny Forester, 1817-'54), Mrs. S. J. Lippincott (Grace Greenwood), Mrs. L. H. Sigourney, Miss O. M. Sedgwick, Miss McIntosh, Mrs. L. C. Tuthill, Mrs. Parton (Fanny Fern), Mrs. L. M. Child, Mrs. A. B. (Neal) Haven, Mrs. H. O. Knight, Mrs. A. A. Carter, Mrs. H. S. Phelps, Mrs. Hubbell, and many others have devoted a large portion of their time to this species of literature.—The poetry of this period, in view of the absorbing industrial life of the people, has shown a remarkably healthy and abundant development; and it is probable that the number of writers is more numerous here than in any other country. Notwithstanding also the limited range of native subjects, which makes the imaginative literature of the country in some respects an imitation or rather a continuation of that of other lands, the grand features of national scenery, legend, and history have not failed of capable illustrators, while the familiar imagery of an older civilization has been often reproduced with force and originality. Among those who have made a felicitous use of native materials, one of the most eminent and thoroughly American is William Cullen Bryant (born 1794), whose poems, the fruits of meditation rather than of passion or imagination, are remarkable for their descriptive powers, their serene and elevated philosophy, and noble simplicity of language. His "Thanatopsis" is in a high strain of contemplative poetry, and the peculiar aspects of nature in the western world have suggested many of his most characteristic minor pieces. Richard H. Dana (born 1787) was one of the first in America to break away from the school of Pope, and his "Buccaneer," a narrative of crime and retribution, had no slight influence in directing the poetical taste of the country. He has been called "the most psychological of American poets," and the solemnity of tone which pervades his works indicates an imagination deeply moved by the tragic and remorseful elements in humanity. Charles Sprague (born 1791) is the author of an "Ode to Shakespeare," a metrical essay on "Curiosity," and a few other pieces; J. G. Percival (1795-1857) possessed a remarkable command of language and metre, and his "Coral Grove" and "New England" are established favorites; the few poetical re-

mains of Washington Allston (1779-1848), including the "Sylphs of the Seasons," evince an exuberant fancy and much metrical skill; and Joseph Rodman Drake (1795-1820) produced the "Culprit Fay," an imaginative poem, exquisitely versified, although the taste of the poet in transporting the fairy mythology of the old world into the primeval solitudes of the new is questionable. Of all American poets who have written so little, the most popular perhaps is Fitz-Greene Halleck (born 1795), whose "Marco Bozzaris" and lines on Robert Burns are fine specimens of the martial lyric and the elegiac poem, as well as of that union of sound with sense which in the estimation of many constitutes the true theory of versification. His longest poem, "Fanny," is pervaded by a light vein of irony, sometimes incongruously introduced into his pieces devoted to serious subjects. The Scripture pieces of N. P. Willis are written with feeling and artistic finish; in his other poems the verbal felicity and sprightly fancy characteristic of his prose writings are discernible. The few brief poems of Ralph Waldo Emerson (born 1803), of which "The Problem" and the lines "To a Humble Bee" afford examples, are remarkable for their quaint imagery and originality of thought. The early song writers of the period are represented by G. P. Morris (born 1802), the most popular of his class in America, and Edward Coates Pinkney (1802-'28) and C. F. Hoffman, whose amatory or convivial verses are gracefully written and well adapted to music. Among other early writers of the period who are remembered for one or more successful poems, are F. S. Key (1779-1843), author of the "Star-Spangled Banner;" R. H. Wilde (1789-1847), of the song commencing "My Life is like the Summer Rose;" and John Howard Payne (1792-1852), whose "Home, Sweet Home" is known wherever the English language is spoken. The poems of E. A. Poe form a fitting accompaniment to his prose writings, and are characterized by a shadowy and gloomy imagination, and a fascinating melody of rhythm. His longest poem, "The Raven," illustrates his facility in harmonizing sentiment with rhythmical expression; and his "Annabel Lee," "Haunted Palace," and "Bells" are constructed with equal skill. The most artistic and cosmopolitan of American poets, and the most widely read abroad, is H. W. Longfellow, whose genius has been powerfully influenced by the literature and historic associations of the old world, while in the choice and treatment of his principal subjects he is eminently American. His minor poems are chiefly meditative, and the harmony of the numbers, the verbal felicity, and the novelty and appositeness of the imagery give life and freshness to the rather trite maxims which they embody. His "Psalm of Life," "Footsteps of Angels," "Light of Stars," "Village Blacksmith," and "St. Augustine's Ladder," familiar specimens of this class, have been aptly described as "gems set with consummate taste." His

"Skeleton in Armor" has much of the spirit of the old Scandinavian legend; and in "Evangeline" and "The Song of Hiawatha" (the latter in theme, sentiment, and treatment, the most thoroughly aboriginal poem yet written) he has made the first successful attempt on a considerable scale to naturalize the hexameter and trochaic measures in English literature. Much of the poetry of J. G. Whittier has been prompted by his opposition to slavery, and in occasional pieces he rises to a strain of genuine lyrical exaltation. Of this character are his "Massachusetts to Virginia" and "Astraea to the Capitol." In other poems he unites tenderness and grace with much simplicity of language. James Russell Lowell (born 1819) is one of the most versatile of the younger poets of this period, and his serious writings are earnest and philanthropic in tone, elevated in sentiment, and of high artistic merit in the construction. He is perhaps the ablest of American satirists, and has gained a unique reputation as a humorist by his "Biglow Papers," in which the peculiar phraseology of New England is given with great verbal and idiomatic correctness. The prose introductions to these poems have a subtle humor which can be best appreciated by those familiar with the local peculiarities they illustrate. Not less conspicuous as a humorist is O. W. Holmes, the most effective writer of the school of Pope, and distinguished by a clear, concise, and manly style. For the mingled pungency and geniality of his humor he is unrivalled among American poets; and his "Old Ironsides" and "La Griseuse" show him capable of high lyric flights as well as of pathetic expression. In his knowledge of local dialects and idioms he is not inferior to Lowell. J. G. Saxe (born 1816) is known chiefly as a humorous poet, and his verses enjoy a considerable popularity. A. B. Street (born 1811) has devoted himself more than any other satiric poet to the romantic aspects of American scenery and forest life, and his works contain many striking and picturesque descriptive passages. Among other poets and occasional writers of verses of this period, all of whom have produced some pieces of high merit, may be mentioned John Pierpont (born 1788), John Neal, J. G. Brainard, Andrews Norton (1786-1853), Henry Ware, jr. (1784-1843), I. Clason, W. G. Simms, R. C. Sands, G. W. Doane, A. G. Greene, Rufus Dawes, Sumner Lincoln Fairfield, James Aldrich, George Lunt, G. W. Bethune, G. D. Prentice, Grenville Mellen, William Croswell, Thomas Ward, W. D. Gallagher, Park Benjamin, Albert Pike, Jones Very, Ralph Hoyt, W. G. Clark, Seba Smith, W. E. Channing, H. T. Tuckerman, H. B. Hirst, W. H. O. Hosmer, Epes Sargent, T. W. Parsons, A. C. Coxe, G. H. Colton, W. W. Story, W. R. Wallace, T. D. English, C. G. Eastman, P. P. Cooke, H. A. Caldwell, C. P. Cranch, W. H. Burleigh, H. R. Jackson, Isaac McLellan, and J. T. Fields; and among the younger writers J. R. Thompson, G. H. Boker, T. B. Reed,

Hayward Taylor, R. H. Stoddard, W. Allan Butler, P. Y. Hayne, O. G. Leland, R. T. S. Lowell, H. H. Caldwell, T. B. Aldrich, A. J. H. Duganne, and E. O. Stedman. The female poets of the period comprise Mrs. Sigourney, author of many beautiful pieces characterized by feminine delicacy and religious sentiment; Mrs. Maria Brooks (Maria del' Occidente, 1795-1845), whose principal poem, "Zophiel," evinces a high degree of imaginative power, and was praised by Southey; Lucretia Maria Davidson (1808-'25), and her sister Margaret Miller Davidson (1823-'88), who are instances of rare though melancholy precocity in the art; Mrs. Frances Sargent Osgood (1812-'50), remarkable for her playfulness of fancy and acuity of expression; Miss H. F. Gould, a pleasing and natural writer; Mrs. Julia Ward Howe (born 1819), whose "Passion Flowers" and other poems are distinguished by a peculiar earnestness of feeling and expression; Mrs. Frances Anne Kemble (born 1811), who exhibits similar characteristics; Mrs. E. Oakes Smith, author of a melodious and imaginative poem entitled "The Sinless Child;" Mrs. Caroline Gilman, Mrs. Lippincott (Grace Greenwood), Mrs. A. B. Welby, Mrs. E. O. Emery, Mrs. Louisa McCoord, Mrs. Sarah Helen Whitman, Mrs. A. C. (Lynch) Botta, Mrs. Estelle Anna Lewis, Mrs. Haven, Miss Alice Carey and her sister Phoebe Carey, Mrs. Ellet, Mrs. S. J. Hale, Miss Caroline May, Mrs. Maria Lowell, Miss Edna Dean Proctor, Mrs. E. P. Lee, Mrs. Rosa V. Johnson, Mrs. L. V. French, Mrs. M. E. Hewitt (Stebbing), Miss Rose Terry, Mrs. M. S. B. Dana (Shindler), and many others. Moral purity, love of nature, domestic affection, and graceful expression are the general characteristics of the writings of the above; and so far as their poetry has exercised any influence on practical life, it has had a tendency to refine taste and cultivate good sentiments. Dramatic literature has been cultivated by comparatively few writers, and, with occasional exceptions, nothing of very decided mark, either in style, sentiment, or plot, has yet been accomplished. J. A. Hillhouse (1789-1841), a man of ripe scholarship and fine taste, excelled in that species of poetic literature illustrated by the writings of Browning, Henry Taylor, and others in England, and which may be called the written drama. His "Haddad," founded upon Jewish tradition, "Percy's Masque," and other dramas, though unfitted for representation, are conceived with taste and carefully finished. G. H. Boker has produced "Calaynos," a tragedy founded on an incident in the history of the Spanish Moors, and other dramatic pieces of more than ordinary merit; and Mrs. J. W. Howe, a high-wrought drama entitled "The World's Own." Among other works of this class may be mentioned "Brutus," by J. H. Payne; "Metamora," by J. A. Stone; "Jack Cade," by R. J. Conrad; "Tortosa the Usurer," and "Bianca Visconti," by N. P. Willis; "Velasco," by Epes Sargent; "The Gladi-

ator," by R. M. Bird; "Witchcraft," by Cornelius Mathews; and "Fashion," by Mrs. A. C. (Mowatt) Ritchie (born 1821); several of which have proved good acting plays, and still retain possession of the stage. In the department of poetry may also be classed several writers who have executed metrical translations of merit from the German, Italian, and other languages. The most eminent of these is Longfellow, whose versions of Bishop Tegnér's "Children of the Lord's Supper," and the *Schwabe Ritter* and other ballads by Uhland, are well known. O. T. Brooks has translated the *Faust* of Goethe and numerous other pieces from the German; C. G. Leland, some of the choicest songs of Heine; W. H. Furness, Schiller's "Song of the Bell;" and N. L. Frothingham and J. S. Dwight, many of the minor poems of this and other German authors. T. W. Parsons has made one of the best English translations of Dante's great epic; George Ticknor has versified choice extracts from the Spanish poets; and R. H. Wilde, Dr. Mitchell, and Mrs. Nichols have translated with taste from Tasso, Sannazaro, and Manzoni.—Under the head of criticism, essays, belles-lettres, lectures or discourses, and that species of miscellaneous works which owe their charm to a felicitous blending of fact and fancy, or of sentiment and thought, may be classed a numerous body of authors who were so inadequately represented in the two preceding periods that the department now under consideration may almost be said to have sprung into existence since 1820. The establishment of the "North American Review" in 1815, followed within a few years by that of the "American Quarterly Review," the "Southern Quarterly Review," the "Christian Examiner," the "Knickerbocker Magazine," and other periodicals, gave the first considerable impulse to literary criticism and essay writing on a comprehensive and philosophic scale; and the production of the essays of William Ellery Channing (1780-1842) on "National Literature," "Milton," "Napoleon Bonaparte," "Fénélon," and "Self-Culture," and of the thoughtful and highly finished articles by R. H. Dana, published in his own "Idle Man" and the "North American Review," may be said to have formed an era in the literary history of the country. Contemporary with these were John Quincy Adams, William Tudor, Joseph Story, Edward and A. H. Everett, W. H. Prescott, F. O. Gray, George Ticknor, E. T. Channing, Robert Walsh, G. O. Verplanck, J. G. Palfrey, Jared Sparks, Samuel Gilman, William Ware, R. O. Sands, Orville Dewey, Dr. J. W. Francis, W. G. Simms, John Neal, Francis Wayland, Henry Reed, F. L. Hawks, O. S. Henry, J. T. Buckingham, and H. S. Legaré, most of whom have written with taste upon subjects connected with philosophy, morals, political and social economy, and general literature. Prominent among the later review writers and essayists is R. W. Emerson, an original and independent thinker, whose views of religion and

in some degree of society may be described as the opposite of all those founded upon tradition and authority. He has written in an abstract manner upon social, moral, and political questions; and his style, though sometimes obscure by reason of his attempts to condense a philosophic theory into a few brief terms, has a finished beauty and significance which have secured him a wide circle of admirers, particularly in New England, where, says Hawthorne, "his mind acted upon other minds of a certain constitution with wonderful magnetism, and drew many men upon long pilgrimages to speak with him face to face." His published works comprise several series of "Essays," "The Method of Nature," "Representative Men," "English Traits," and "The Conduct of Life," several of which have been expanded from lectures and addresses, a department of literature to which he has principally devoted himself. Of the school of Emerson was Margaret Fuller Ossoli (1810-70), author of "Woman in the Nineteenth Century," an earnest protest against the commonly received views of the social position of women, and "Papers on Literature and Art," some of which originally appeared in the "Dial," a quarterly publication which was for several years the organ of Emerson and his friends. She wrote with point and brilliancy, and in general acquirements and conversational powers was probably the leading woman of her time in America. The most conspicuous names among the younger writers are those of E. P. Whipple, author of many papers, chiefly on literature, written in a lively and perspicuous style; H. T. Tuckerman, whose contributions to the critical literature of the country show a refined taste and a liberal cultivation of mind and heart; O. A. Brownson, a bold and powerful writer on religion, metaphysics, and politics; G. S. Hillard, O. C. Felton, F. H. Hedge, G. E. Ellis, W. H. Furness, W. B. O. and O. W. B. Peabody, G. H. Calvert, Henry Giles, Mrs. Mary Putnam, R. W. Griswold, J. F. Clarke, A. P. Peabody, O. H. Brigham, O. B. Frothingham, and Thomas Hill. Any thing like a complete enumeration of the writers who have gained distinction in the wide field of belles-lettres or magazine literature would be impossible within the limits of this article; and only those who are generally known or who may stand as representatives of their class can be mentioned. The most distinguished of all is Washington Irving, whose "Crayon Papers," published in England in 1822 under the title of "The Sketch Book," represents perhaps the author's most successful attempts in elegant literature. The "Inklings of Adventure," "Pencilings by the Way," "Letters from under a Bridge," and other piquant sketches of people and manners, by N. P. Willis; the series of discursive essays by O. W. Holmes, entitled the "Autocrat of the Breakfast Table" and the "Professor at the Breakfast Table;" the "Reveries of a Bachelor," by D. G. Mitchell (Ik

Marvel); the "Potiphar Papers," by G. V. Curtis; "Meister Karl's Sketch Book," by G. Leland; and the "Fern Leaves" of H. Parton, are popular examples of what has been accomplished by other authors. To these may be added those of John Sanderson, G. V. Bethune, M. M. Noah, N. Biddle, Mrs. C. G. man, James Lawson, T. S. Fay, R. M. Charle, J. J. Jarves, A. K. Gardner, A. B. Alcott, O. F. Hoffman, E. S. Gould, E. Sanford, J. L. H. McCracken, G. H. Calvert, L. L. Noble, Pat Benjamin, W. G. and L. G. Clark, E. A. Pe Mrs. Kirkland, Theodore Sedgwick, H. W. Herbert, H. B. Wallace, C. W. Webber, G. W. Peck, W. E. Burton, Robert Turnbull, J. L. Motley Miss Susan Fenimore Cooper, Mrs. Botta, Eves Sargent, Robert Tones, O. O. Pise; and the following, which of late years have been more immediately before the public: H. D. Thoreau, E. H. Chapin, Samuel Osgood, H. W. Bellows Parke Godwin, J. R. Lowell, C. A. Bristed (Carl Benson), J. G. Holland (Timothy Titcomb), R. G. White, J. Milton Mackie, T. W. Higginson, R. Strother, C. F. Briggs, E. K. Hale, G. D. Prentice, George Sumner, C. E. Norton, and Theodore Winthrop. Among the works illustrating English literature may be mentioned the lectures on Shakespeare by R. H. Dana and H. N. Hudson, and the editions of the poet by G. C. Verplanck, H. N. Hudson, and R. G. White; the edition of Spenser by G. S. Hillard; those of Wordsworth and Gray by Henry Reed; that of Milton by C. D. Cleveland; that of Coleridge by W. T. G. Shedd; the elaborate series of British poets by F. J. Child, assisted by J. R. Lowell and others; and various writings by R. H. Dana, A. H. Everett, J. R. Lowell, J. S. Hart, E. P. Whipple, and R. W. Emerson. Translations from the German metaphysicians and historians have been made by George Bancroft, S. M. Fuller, G. H. Calvert, W. H. Channing, F. H. Hedge, and Samuel Osgood; and from educational and scientific authors as well as writers of fiction in Germany and France, by a variety of hands. The department of oratory and political science, though relatively less prominent than in the preceding period, occupies an important place in contemporaneous American literature; and the speeches and writings of Daniel Webster (1782-1852), Henry Clay (1777-1852), and J. C. Calhoun (1782-1850), considered merely as literary productions, are among the intellectual triumphs of the country. For dignity of expression, breadth and force of thought, and a style strong, simple, and sometimes grand, the forensic arguments and public and political speeches of Webster may rank with the masterpieces of oratory in any language. The spontaneous, impassioned eloquence of Clay, on the other hand, depended so much for its effect upon the voice and manner of the speaker, that his reputation will be mostly traditional. His published speeches give little indication of the mastery of the feelings for which he was almost unrivalled. Calhoun's eloquence was plain,

strong, concise, and only occasionally impassioned; and his power, as Webster has observed, "consisted in the plainness of his propositions, the closeness of his logic, and in the earnestness and energy of his manner." His literary remains exhibit unusual philosophical acumen and power of analysis. To the political orators and statesmen of this period belong also John Quincy Adams (1769-1848), remarkable for the universality of his knowledge and his independence of judgment; John Randolph of Roanoke (1798-1832), an eccentric but powerful and pointed speaker, and a master of invective; Albert Gallatin (1761-1849); R. Y. Hayne (1791-1839), the eloquent antagonist of Webster; De Witt Clinton (1769-1828), Tristram Burgess (1770-1858), George McDuffie (1788-1851), Silas Wright (1795-1847), H. S. Legaré (1797-1848); W. C. Preston (1794-1860), and S. S. Prentiss (1808-'50), whose productions represent the most ornate and florid school of American oratory; T. H. Benton (1782-1858), whose "Thirty Years' View" and "Abridgment of the Debates in Congress" afford invaluable materials to the historian of national politics; A. H. Everett (1792-1847), J. R. Poinsett (1779-1851), Lewis Cass (born 1782), Levi Woodbury (1789-1851), Caleb Cushing (born 1800), John Sergeant (1779-1852), W. H. Seward (1801), J. J. Crittenden (1785), J. M. Hammond (1807), R. C. Winthrop (1809), H. A. Wise (1806), S. A. Douglas (1813-'61), and R. M. T. Hunter (1809). The most accomplished orator of the period with respect to rhetorical finish and elocution is Edward Everett (born 1794), whose productions, including his oration on Washington, which has been delivered before public assemblies in many parts of the country, are thoroughly American in tone, and possess a permanent and intrinsic merit. Rufus Choate (1799-1859), in his forensic arguments and occasional public addresses, exhibited not less rhetorical excellence and more fervor than Everett; and Charles Sumner (born 1811) excels in strength and clearness of statement, ripe scholarship, and nobility of diction. Among the anti-slavery orators, to which class Mr. Sumner properly belongs, may be enumerated Wendell Phillips (born 1811), a vigorous and impulsive speaker, frequently rising to a strain of impassioned eloquence; J. R. Giddings (1795), Cassius M. Clay (1810), Theodore Parker (1810-'60), Henry Ward Beecher (1813), R. W. Emerson, Frederic Douglass (1817), and G. B. Cheever (1807), whose oratory in general exhibits similar characteristics. The list of occasional orators, in addition to the names of most of the foregoing, includes those of Joseph Story (1779-1845), James Kent (1763-1847), G. O. Verplanck (1786), Horace Binney (1780), T. S. Grimke (1786-1834), Orville Dewey (1794), Horace Bushnell (1802), E. H. Chapin (1814), H. B. Bascom (1796), G. S. Hillard (1808), H. W. Bellows (1814), and many others. The political writers comprise William

Sullivan, (1774-1839), Matthew Carey (1760-1830), J. T. Buckingham, Martin Van Buren (1782-1862), W. L. Marcy (1786-1857), Thomas Ritchie, Joseph Gales, Robert Walsh, Isaac Hill, William Leggett (1802-'39), Amos Kendall, Calvin Colton, J. H. Hammond, Nathan Hale, David Hale, Richard Hildreth, Joshua Leavitt, Morton McMichael, Hamilton Pleasants, T. R. Cobb, G. D. Prentice, W. C. Bryant, J. G. Palfrey, Robert Barnwell Rhett, Joseph Chandler, James Gordon Bennett, J. D. B. De Bow, John Fletcher, George Fitzhugh, J. L. O'Sullivan, Edwin Croswell, Thurlow Weed, J. W. Forney, Horace Greeley, Parke Godwin, H. J. Raymond, N. Paschall, B. Gratz Brown, O. H. Ray, James Brooks, Erastus Brooks, and many others. Under this head also come the comprehensive "Commentaries on the Constitution of the United States," by Justice Story, the lectures on the same subject by W. A. Duer (1780-1858), and the "Constitutional History of the United States," by G. T. Curtis. The most eminent writers on political economy are H. C. Carey (born 1793), whose "Principles of Political Economy," "Credit System in France, England, and the United States," "The Past, the Present, and the Future," and numerous other works, maintain protection doctrines in a clear, terse style; President Francis Wayland (born 1796) and Henry Vethake, the latter an advocate of free trade, who have published valuable text books on the subject; Francis Lieber, A. H. Everett, William Leggett, Beverly Tucker, Albert Gallatin, John Bristed, Calvin Colton, Condy Raguet, Stephen Colwell, Francis Bowen, Alonzo Potter, E. C. Seaman, E. Peshine Smith, George Opdyke, W. M. Gouge, and William Maclure. The writers on social science and ethics comprise Francis Lieber, author of treatises on "Liberty and Self-Government" and "Political Ethics;" G. H. Calvert, T. Sedgwick, A. Gurowski, Bishop J. H. Hopkins, who have discussed the subject generally. W. L. Garrison, Richard Hildreth, T. D. Weld, H. R. Helper, M. D. Conway, E. M. Stearns, T. Stringfellow, G. Fitzhugh, A. T. Bledsoe, and others have written on the institution of slavery; W. P. Foulke, L. Dwight, J. S. Gould, and Miss Dorothea L. Dix, on prison discipline and kindred topics; and Mrs. O. H. Dall on the rights of woman.—In no department has the intellectual development of the country been more conspicuous than in that of jurisprudence, and the treatises, digests, and reports emanating from American authors and jurists already fill several thousand volumes, and form a valuable addition to legal literature. The "Commentaries on American Law," by James Kent, published in 1826-'30, are written with great clearness and force of reasoning, and constitute the chief manual of general reference and elementary instruction. Of the numerous works of Justice Story, those on equity jurisprudence, partnership, bailments, and "The Conflict of Laws" are well known everywhere; the "Elements of International Law" and "History

of the Law of Nations," by Henry Wheaton, have become standard works of reference in Europe; and the treatises of Edward Livingston on penal law, of Simon Greenleaf on evidence, of Willard Phillips on insurance, of F. Wharton on criminal law, beside many by David Hoffman, St. George Tucker, J. K. Angell, John Bouvier, G. T. Curtis, L. S. Cushing, W. A. and John Duer, F. Hilliard, Murray Hoffman, Theophilus Parsons, Theodore Sedgwick, W. W. Story, and others, are creditable to the legal learning of the country. —The theological and religious writers of the period comprise a numerous and able body, whose works, devoted rather to practical illustration than to theoretical speculation, have in many instances become standard authorities on the subjects of which they treat, and, in view of the multiplicity of sects from which they emanate, express unusually broad and catholic views. In the department of biblical criticism American theologians are everywhere honorably distinguished. Of Presbyterian writers, the most eminent are Samuel Miller (1769–1850), author, among other works, of several treatises on the distinguishing features of Presbyterianism; Edward Robinson (born 1794), best known by his researches in biblical geography; Albert Barnes (1798), whose "Notes on the Gospels" and commentaries on other portions of Scripture are widely known in America and England; Nicholas Murray (Kirwan), author of several controversial publications; S. Davies, Ashbel Green (1762–1848), Gardiner Spring (1785), Charles Hodge (1797), James Richards (1798–1843), R. J. Breckinridge (1800), Archibald, J. W., and Joseph A. Alexander, T. H. Skinner, I. S. Spencer, William Adams, Thomas Smyth, Robert Baird, J. H. Thornwell, and J. B. Walker. The Trinitarian Congregationalists are represented by Moses Stuart (1780–1852), author of various scriptural commentaries, and distinguished as a philologist; Leonard Woods (1798–1854), Horace Bushnell (born 1802), Edwards A. Park (1808), Lyman Beecher (1775), Edward Beecher (1804), N. W. Taylor, Bennet Tyler, E. N. Kirk, Nehemiah Adams, Mark Hopkins, Nathan Lord, Joel Hawes, Leonard Bacon, G. B. Cheever, J. P. Thompson, T. O. Upham, J. Torrey, W. G. T. Shedd, Henry B. Smith, and George Punchard, author of a "History of Congregationalism," &c. At about the commencement of this period a memorable controversy took place in New England between Samuel Worcester, representing the conservative or orthodox Congregationalists, and W. E. Channing in behalf of the Unitarians, who thenceforth became an independent, and, in proportion to their numbers, an important sect. The writings of Channing had great influence in moulding the opinions now generally held by Unitarians in America, and contemporary with him were a body of divines and scholars of considerable literary culture, resident chiefly in Boston and its vicinity, and whose education was acquired at Harvard college, where a large

proportion of the Unitarian clergy have since been graduated. Prominent among these were Andrews Norton (1786–1853), author of a treatise on the "Genuineness of the Gospels;" Henry Ware, Henry Ware, jr., and William Ware, J. G. Palfrey, Jared Sparks, N. L. Frothingham, James Walker, Orville Dewey, F. W. P. Greenwood, W. H. Furness, and G. W. Barnap. Of somewhat later date are A. P. Peabody, Samuel Osgood, F. H. Hedge, G. E. Ellis, H. W. Bellows, A. A. Livermore, C. A. Bartol, A. B. Muzzey, and J. F. Clarke. Distinguished from these is a new rationalistic school of Unitarianism, chiefly represented by Theodore Parker (1810–'60), whose writings evince profound scholarship and logical method, and furnish frequent examples of rhetorical beauty and force. On political and social questions he also wrote and spoke with peculiar earnestness. The principal writers of the Protestant Episcopal denomination are Bishop O. P. Mellvaine, author of a treatise on the "Evidences of Christianity;" Bishop T. C. Brownell, author of commentaries on the "Book of Common Prayer;" Bishops Alceus Potter, George Burgess, J. M. Wainwright, J. H. Hopkins, and W. I. Kip; S. F. Jarvis, S. H. Tyng, F. L. Hawks, J. S. Stone, A. C. Cox, S. H. Turner, G. T. Bedell, R. A. Hallam, T. W. Coit, F. D. Huntington, Calvin Colton, G. O. Verplanck, A. H. Vinton, J. A. Spencer, and Samuel Seabury. Among the Baptists, the most noted are President Francis Wayland, William Hague, H. B. Hackett, E. J. Ripley, Baron Stow, Alvah Hovey, W. R. Williams, T. J. Conant, J. Balcher, R. Turnbull, Richard Fuller, and J. B. Jeter; and among the Methodists, Nathan Bangs, P. D. Gorrie, John and Robert Emory, Stephen Olin, H. B. Bascom, D. D. Whedon, J. McClintock, Abel Stevens, W. P. Strickland, D. Curry, James Floyd, D. Wise, Osmyrn Baker, Thomas Stockton, B. F. Tefft, and Alexander Green. The Roman Catholics are represented by Archbishop F. P. and P. R. Kenrick and John Hughes, the last two chiefly distinguished as controversial writers; Bishops J. England and H. Spaulding; I. T. Hecker and O. A. Brownson, who has written several of his most noticeable review articles on theological subjects. In other denominations the prominent names are George Bush, a follower of Swedenborg, and author of a treatise on the "Doctrine of the Resurrection of the Body" and numerous commentaries and miscellaneous writings; Philip Schaff, J. W. Nevins, and H. Harbaugh, of the German Reformed, and S. S. Schmucker, of the Lutheran church; Hosea Ballou, E. H. Chapin, and T. Whittemore, of the Universalist denomination; and T. Evans and S. M. Janney, members of the society of Friends. Many of the above, including Brownson, Parker, Walker, and Wayland, have written on moral philosophy and metaphysics. The school of Locke is represented by Francis Bowen, Frederic Beasley, and others; while Parker, Walker, James Marsh, and Emerson have borrowed more or less from the German

idealists and the French eclectics. C. S. Henry and O. W. Wight have made the philosophy of Cousin familiar to American readers; J. Marsh has expounded the doctrines of Coleridge; and Samuel Tyler has produced, in his "Discourse on the Baconian Philosophy," one of the most profound metaphysical disquisitions of the century. Other contributors to this department are Herman Hooker, Hubbard Winslow, Joseph Haven, H. P. Tappan, Asa Mahan, T. O. Upham, Henry James, Roswell Park, W. T. G. Shedd, W. D. Wilson, Job Durfee, L. P. Hickok (whose systematic writings on the higher branches of philosophy are among the ablest specimens of profound discussion), and George Payne.—Under the head of philology may be mentioned the two great dictionaries of the English language by Noah Webster (1758–1843) and Joseph E. Worcester (born 1784), which have superseded all others in popular use in the United States; the "Lectures on the English Language" and other works by G. P. Marsh; the "Dictionary of Americanisms," by J. R. Bartlett; and the writings of Gould Brown, W. S. Fowler, and others who have devoted themselves particularly to the structure and etymology of the English language. The aboriginal languages of North America have been treated by John Pickering, Albert Gallatin, H. R. Schoolcraft, P. E. Duponceau, E. G. Squier, W. W. Turner, and Mrs. Eastman; and grammars and vocabularies of the most important dialects have been prepared by missionaries and others specially interested in the subject. In oriental literature the investigations of American philologists have been of great value; and to American scholars, and particularly missionaries, Europe is largely indebted for its knowledge of a number of the languages of eastern Asia, Africa, and the Pacific islands. Among those who have gained eminence by their contributions to biblical philology are Edward Robinson and Taylor Lewis, both also distinguished as Greek scholars; Moses Stuart, S. H. Turner, J. W. Gibbs, B. B. Edwards, G. R. Noyes, George Bush, T. J. Conant, and H. B. Hackett. In other branches of oriental philology the chief works are the "Burmese Dictionary," by Adoniram Judson; the "English and Chinese Vocabulary," by S. Wells Williams; and the "Grammar and Dictionary of the Karen Language," by F. Mason; beside the writings of W. W. Turner, Professors W. D. Whitney and E. E. Salisbury of Yale college, J. G. Palfrey, E. Riggs, W. W. Greenough, and Charles Kraitsir, several of whom have contributed important papers to the "Journal of the American Oriental Society." Among miscellaneous philological writers may be enumerated O. A. Goodrich, Professor Schele de Vere, and Horatio Hale, author of the "Ethnography and Philology of the United States Exploring Expedition" under the command of Capt. Wilkes.—The contributions to ethnology comprise some of the most costly works which have yet appeared from the American press.

Among these may be enumerated the "Crania Americana," "Crania Aegyptica," and other works by S. G. Morton (1799–1851); the "Biblical and Physical History of Man," by J. O. Nott (born 1804); the elaborate "Types of Mankind" and "Indigenous Races of the Earth," both profusely illustrated, by J. O. Nott and G. R. Gliddon; the "Diversity of Origin of Human Races," by Louis Agassiz (born 1807); the "Doctrine of the Origin of the Human Race," by John Bachman; the "Progress of Ethnology," by J. R. Bartlett; the "Races of Men and their Geographical Distribution," by Charles Pickering; and other works by Arnold Guyot, F. W. Redfield, T. Smyth, and A. Meigs. Intimately connected with this department are the works illustrating the origin and antiquities of the aboriginal tribes of America, the most important of which are the elaborate series by H. R. Schoolcraft, and more particularly his "Historical and Statistical Information" previously mentioned; the "American Antiquities and Researches into the Origin of the Red Race," by A. W. Bradford; the "Ancient Monuments of the Mississippi Valley," by E. G. Squier and E. H. Davis; the "Aboriginal Monuments of the State of New York," and the "Serpent Symbol," by E. G. Squier; and various writings by Albert Gallatin, J. L. Stephens, W. W. Turner, G. Catlin, and others.—The number of works devoted to travel and exploration is greatly in excess of that of either of the preceding periods; and the contributions to geographical knowledge, particularly on the American continent, have been numerous and important. Among the works illustrating European travel and scenery may be mentioned "Pleasant Memories of Pleasant Lands," by Mrs. Sigourney; "The Old World and the New," by Orville Dewey; "Letters from Abroad," by Miss Sedgwick; "A Year in Spain" and "Spain Revisited," by A. S. Mackenzie; "Pencilings by the Way," by N. P. Willis; "The Pilgrim in the Shadow of Mont Blanc," by G. B. Cheever; "Six Months in Italy," by G. S. Hildard; "Views a-Foot," and other works by Bayard Taylor (born 1825), one of the most active and entertaining of modern travellers; "Sunny Memories of Foreign Lands," by Mrs. Stowe; "Hungary in 1851" and "The Norse Folk," by C. L. Brace; and many by W. O. Bryant, William Ware, Caleb Cushing, H. T. Cheever, J. T. Headley, Calvin Colton, Pliny Miles, Benjamin Silliman, S. I. Prime, Horace Greeley, H. T. Tuckerman, J. A. Dix, R. Sanderson, Mrs. Kemble, Mrs. Octavia W. Le Vert, Miss A. O. Johnson, and others. The most noticeable books upon the East are the two series of "Biblical Researches in the Holy Land," by Edward Robinson, the result of an extended tour in the East, and which are regarded by biblical scholars everywhere as of the highest value; "Travels in Egypt, Arabia Petraea, and the Holy Land," by J. L. Stephens; "The Land and the Book," by W. M. Thomson;

"The Pathways and Abiding Places of Our Lord," by J. M. Wainwright; "Nile Notes of a Howadji" and "The Howadji in Syria," by G. W. Curtis; "Boat Life in Egypt and Nubia" and "Tent Life in the Holy Land," by W. O. Prime; "Yusef," by J. Ross Browne; "The Middle Kingdom," by S. Wells Williams; beside others by Bayard Taylor, W. Colton, Horatio Southgate, Stephen Olin, S. I. Prime, and R. B. Minturn. Books of maritime adventure or travel may be represented by W. S. W. Ruschenberger's "Voyage round the World" and "Three Years in the Pacific;" R. H. Dana, jr.'s "Two Years before the Mast;" Walter Colton's "Deck and Port," and other works; H. T. Cheever's "Island World of the Pacific;" H. A. Wise's "Los Gringos;" and Charles Nordhoff's "Man-of-War Life," and other highly graphic narratives of a similar character. Of works relating to the United States and its territories, the most important are Irving's "Astoria" and "Tour on the Prairies," which in point of style and interest are not inferior to any thing he wrote; Timothy Flint's "Residence and Wanderings in the Valley of the Mississippi;" the various narratives of travel on the upper Mississippi by Schoolcraft; Bayard Taylor's "El Dorado;" the accurate and graphic "Journey in the Seaboard Slave States," "Journey through Texas," and "Journey in the Back Country," by F. L. Olmsted; and many by George Catlin, G. W. Kendall, J. T. Headley, T. B. Thorpe, H. Greeley, O. W. Webber, F. Parkman, and others. The geography and antiquities of Central America have been elaborately described by J. L. Stephens in his "Travels in Central America" and "Incidents of Travel in Yucatan;" by E. G. Squier in his "Nicaragua" and "Notes on Central America;" and by B. M. Norman in his "Ruined Cities of Yucatan." Among other works relating to the American hemisphere are F. F. Holton's "New Granada;" O. S. Stewart's "Brazil and La Plata;" "Brazil and the Brazilians," by D. P. Kidder and J. C. Fletcher; John Bigelow's "Jamaica in 1850;" R. B. Kimball's "Letters from Cuba" and "Cuba and the Cubans;" W. H. Hurlburt's "Gan Eden, or Pictures of Cuba;" and F. S. Cozzens's "Acadia." A peculiar and important class of books of travel has resulted from the explorations undertaken at various times by the United States government, with a view of adding to the general stock of geographical knowledge, or of developing the resources of its own territory. The most elaborate of these is the "Narrative of the United States Exploring Expedition around the World," by Capt. Charles Wilkes, in 5 volumes; and of not less importance to the cause of geographical science are the narratives of exploration among the Rocky mountains and in Oregon and California by Col. John Charles Fremont, for which he received the gold medal of the royal geographical society of Great Britain; and the reports of expeditions to the Red river of Louisiana, by Capt. R. B.

Marcy; to Texas and New Mexico, by J. R. Bartlett; to Utah, by Capt. Howard Stansbury; to Arizona and the Gila river, by Lieut. Col. W. H. Emory; to the southern hemisphere, by Lieut. J. M. Gilliss; to Japan, by Commodore M. L. Perry; to the Rio de La Plata, by Lieut. T. S. Page; to the Amazon, by Lieut. W. L. Hernan and L. Gibbon; and to the Dead sea, by Lieut. W. F. Lynch. The chief arctic explorers are Elisha Kent Kane (1820-'57), whose narratives of the two Grinnell expeditions in search of John Franklin are among the most interesting works of their class yet produced; and L. L. Hayes, author of "An Arctic Boat Journey." —The wide field of natural history has been explored during this period with results highly creditable to the sagacity and industry of American philosophers. The most important work in this department, and the most costly ever published in the country, is the "Birds of America," by John James Audubon (1780-1851), remarkable for the vivacity of its descriptive passages and its splendid illustrations. American zoology has been further treated by Charles Lucien Bonaparte, Thomas Nuttall, J. P. Giraud, and John Cassin, who have written on ornithology; by Louis Agassiz, whose publications on comparative embryology, ichthyology, the geographical distribution of animals, and analogous subjects, are of the highest order of merit; by J. E. Holbrook, author of the most complete work on North American herpetology yet published; by Thomas Say, T. M. Harris, and J. L. Le Conte, who have written on entomology; and by Zadoc Thompson, A. A. Gould, B. S. Barton, T. A. Conrad, J. D. Dana, Isaac Lea, Jeffries Wyman, J. Bachman, J. E. De Kay, J. D. Godman, V. G. Audubon, S. Kneeland, jr., and a number of others, who have illustrated various branches of the subject. The most eminent writers on botany are Asa Gray, author of several valuable elementary works and manuals; John Torrey, who is now preparing in conjunction with Gray the most complete American flora yet undertaken; Amos Eaton, Stephen Elliot, Thomas Nuttall, A. B. Strong, Jacob Bigelow, D. J. Browne, and Alphonso Wood; on geology, President Edward Hitchcock, Samuel Machure, W. B. and H. D. Rogers, J. G. Percival, Ebenezer Emmons, T. Sterry Hunt, C. T. Jackson, D. B. Owen, J. D. Whitney, J. W. Forster, W. C. Redfield, C. H. Hitchcock, J. T. Hodge, James Hall, Joseph Leidy, H. C. Lea, and W. W. Mather, of whom the last four are also distinguished as paleontologists; and on mineralogy, Professor J. D. Dana, author of a well known "Treatise on Mineralogy," P. Cleaveland, L. O. Beck, and C. U. Shepard. The writers on chemistry include Benjamin Silliman and Benjamin Silliman, jr., Robert Har, O. T. Jackson, J. W. Draper, Joseph Henry, E. N. Horsford, John Torrey, E. L. Youmans, and Campbell Morfit; and in other branches of natural science the most noted names are M. F. Maury, author of the "Physical Geography

of the Sea" and other works, W. C. Redfield, J. P. Espy, and John Brocklesby, distinguished as meteorologists; J. W. Bailey, an eminent microscopist; A. D. Bache, the superintendent of the United States coast survey; Joseph Henry, who has made important discoveries in electro-magnetism; Samuel Forry and Lorin Blodgett, climatologists; and S. C. Walker, B. A. Gould, G. P. Bond, O. M. Mitchell, Denison Olmsted, J. M. Gilliss, Hannah M. Peterson, Maria Mitchell, W. A. Norton, and Elias Loomis, distinguished chiefly as astronomers. The most eminent mathematician whom the country has yet produced is Nathaniel Bowditch (1773-1838), author of a translation, with a commentary, of Laplace's *Mécanique céleste*, and of the well known "Practical Navigator," now in almost universal use. Other writers on mathematics are Benjamin Peirce, Charles Davies, O. H. Davis, and Thomas Hill. Many of the above named have been contributors to the reports and publications of the Smithsonian institution, or have participated in the scientific labors of the United States exploring expedition and similar undertakings.—Of the numerous works on medicine and surgery produced during this period, it will suffice to mention the "Treatise on the Practice of Medicine," by G. B. Wood; "Dispensatory of the United States," by G. B. Wood and F. Bache; "Elements of Medical Jurisprudence," by J. B. and T. Romeyn Beck; "Elements of Pathological Anatomy," by S. D. Gross; "Materia Medica and Therapeutics," by J. Eberle; "The Principles of Surgery," by W. Gibson; "The Elements of Medicine," by S. H. Dickson; the treatises on "Midwifery" and "Diseases of Females," by W. P. Dewees; the treatise on "Obstetrics," by O. D. Meigs; the "Human Physiology" and "Dictionary of Medical Science," by R. Dunglison; "American Medical Botany" and "Nature in Disease," by Jacob Bigelow; "Letters to a Young Physician," by James Jackson; and "Surgical Observations on Tumors," by J. O. Warren; beside which there are many of reputation by D. Hosack, J. W. Francis, S. G. Morton, J. W. Draper, S. Forry, J. Bell, P. Earle, O. W. Holmes, G. S. Bedford, Horace Green, C. A. Harris, W. E. Horner, P. S. Physick, O. Wistar, Martyn Paine, Valentine Mott, J. Pancoast, L. V. Bell, W. W. Sanger, A. Brigham, L. M. Lawson, T. D. Mitchell, T. D. Mutter, Bennet Dowler, J. A. Swett, Daniel Drake, Charles Caldwell, H. H. Smith, E. Parrish, J. King, A. Stillé, Winslow Lewis, G. Hayward, J. W. Smith, P. Townsend, W. W. Gerhard, J. R. Cox, P. F. Eve, S. F. Condie, J. O. Dalton, and W. H. Van Buren. The principal writers of the homoeopathic school are O. Hering, E. E. Marcy, J. O. Peters, J. H. Pulte, and O. J. Hempel.—The theory of education has occupied a large share of the attention of American writers during this period; and among many valuable works on the subject may be mentioned the "Lectures on Educa-

tion," by Horace Mann (1796-1859); "National Education in Europe," by Henry Barnard; "The Theory and Practice of Teaching," by D. P. Page; "The Student's Manual," by John Todd; "University Education," by Chancellor H. P. Tappan; "The School and Schoolmaster," by Bishop Alonzo Potter and G. B. Emerson; beside others by F. A. P. Barnard, William Russell, Barnes Sears, G. F. Thayer, W. A. Alcott, W. C. Woodbridge, Hubbard Winslow, A. B. Alcott, W. H. McGuffey, J. S. Hart, and S. G. Howe. Under this head may also be included the "Five Years in an English University," by C. A. Bristed. The general excellence and enormous production and sale of school books are perhaps the most remarkable features of American literature. It will suffice here to mention the Latin lexicons of F. P. Leverett and E. A. Andrews; the Latin and Greek grammars and elementary books of Andrews, O. C. Felton, Charles Anthon, J. McOlinstock, J. Hadley, J. R. Boise, A. Crosby, A. Harkness, E. A. Sophocles, P. Bullions, and S. H. Taylor; and the editions of classical authors by President T. D. Woolsey, Anthon, Felton, H. S. Frieze, T. A. Thacher, Tayler Lewis, J. J. Owen, J. L. Lincoln, C. S. Wheeler, and C. K. Dillaway. English grammar and composition have been treated by Samuel Kirkham, Gould Brown, J. Greenleaf, P. Bullions, W. H. Wells, Allan Weld, R. G. Parker, and G. P. Quackenbos; and the spelling books of Noah Webster, O. W. Sanders, and S. Town have had a prodigious circulation. The chief writers of mathematical text books are Daniel Adams, Warren Colburn, O. W. Hackley, O. Davies, E. Loomis, G. R. Perkins, T. Sherwin, B. Greenleaf, F. Emerson, D. Leach, W. M. Gillespie, W. D. Swan, and J. F. Stoddard; and of school geographies, atlases, etc., W. C. Woodbridge, Mrs. Emma Willard, Jesse Olney, J. E. Worcester, R. C. Smith, S. A. Mitchell, F. McNally, and Miss S. S. Cornell.—Among works on the science of war may be mentioned those on military tactics by Lieut. Gen. Winfield Scott (born 1786) and W. J. Hardee; A. Mordecai's "Artillery for the United States Land Service;" D. H. Mahan's works on civil engineering, fortifications, &c.; H. W. Halleck's "Elements of Military Art and Science;" J. A. Dahlgren's "System of Boat Armament" and "Shells and Shell Guns;" C. B. Stuart's "Naval Dry Docks of the United States;" J. G. Barnard's "Notes on Sea Coast Defence;" J. H. Ward's "Elementary Course of Instruction in Ordnance and Naval Gunnery;" De Hart's "Constitution and Practice of Courts Martial;" Col. H. L. Scott's "Dictionary of Military Science;" beside many by J. G. and B. J. Totten, E. L. Vielé, W. N. Jeffers, jr., H. D. Grafton, J. G. Benton, and others.—Comparatively few authors have written on the fine arts; the most prominent are W. Dunlap, author of a "History of the Arts of Design in America;" J. J. Jarves, author of "Art Hints" and "Art Studies;" Washington Allston, Horatio Greenough, H. T. Tuckerman, B. J.

Leasing, W. H. Fry, Mrs. H. F. Lee, Thomas Hastings, and Lowell Mason, who have devoted themselves to sculpture, painting, and music. Rural architecture and landscape gardening have been illustrated by A. J. Downing (1815-'82) in a number of gracefully written treatises and essays; and Samuel Sloan, O. Vaux, G. Wheeler, T. W. Walter, R. Upjohn, M. Field, and others have published general works on architecture. Of the numerous works produced on agricultural and horticultural subjects may be cited "European Agriculture and Rural Economy," by H. Colman; the "Farmer's Companion" and "Farmer's Instructor," by Jesse Buel; E. Ruffin's "Calcareous Manures;" E. L. Allen's "American Herd Book" and "American Farm Book;" R. Buist's "American Flower Garden Directory;" Downing's "Fruit and Fruit Trees of America;" "The Fruit Garden," by P. Barry; the "Fruit Trees of America," by O. M. Hovey; the "Muck Manual," by S. L. Dana; H. S. Randall's "Sheep Husbandry;" L. T. Smith's "American Farmer's Hand-Book;" beside many valuable publications by J. S. Skinner, O. L. Flint, J. J. Mapes, D. J. Browne, T. Bridgman, W. Gaylord, L. Tucker, H. S. Olcott, and others. The useful manuals of Mrs. Hale, Miss O. E. Beecher, and Miss Leslie represent the contributions to domestic economy. J. R. Snowden and W. C. Prime are the principal writers on numismatics; E. Jarvis, L. Shattuck, J. Chickering, and J. D. B. De Bow represent the statisticians; James Renwick and Thomas Ewbank the writers on mechanics; H. W. Herbert has a unique reputation as a writer on field sports in America; and O. E. Lester has been a prolific miscellaneous author. Among the miscellaneous literature of the period may be classed the numerous volumes of "Collections" and "Memoirs" illustrating the national history, published by the historical societies of the several states, particularly by those of Massachusetts, New York, and Pennsylvania. The "Archæologia Americana," or transactions of the American antiquarian society, form also a valuable contribution to the archæological literature of the country. Lastly, the foundations of American bibliography have been laid by the valuable works of Isaiah Thomas, O. A. Roobach, G. P. Putnam, Nicholas Trübner, Herman Ludewig, H. Ternaux, H. Stevens, O. Rich, and E. B. O'Callaghan. The periodical literature of the country is treated under that head, and also under NEWSPAPERS.

UNIVERSALISTS, a religious denomination, holding the final destruction of evil, and the restoration of all souls through Jesus Christ. The following statement will probably represent the belief of the great majority of Universalists of the present day. I. They believe that God is infinite in all his perfections, creating man with the fixed purpose that the existence he was about to bestow should prove a final and everlasting blessing; that, foreseeing all the temptations, transgressions, and struggles

of man, he shaped his government, laws, and penalties with express reference to these emergencies, and adapted the spiritual forces to the final overcoming of all evil; that being almighty, he can convert and save a world of sinners as easily as he converted and saved Saul of Tarsus or Matthew the publican, and without any more violation of "free agency" in the one case than in the other. They also believe in the perfection of the divine justice, and affirm, on this ground, that God would not impose on finite beings a law infinite in its demands and penalties; but that, being perfectly just, he will deal with every man according to his works, whether good or bad. II. They uniformly reject the doctrine of the Trinity, giving to Christ the second place, and making him subordinate to the Father. They believe that he is gifted with spirit and power above all other intelligences; that he is "God manifest in the flesh," i. e., that God has displayed in him the brightness of his glory and the express image of his person, as in no other being tabernacled in flesh; that he was sent of God to be the Saviour of the world, and that he will actually save it, because God would not offer, nor would Christ accept, a mission which both knew would end in failure; therefore, they say, the work of redemption will be thorough and universal. III. They believe that man was and is created upright, but liable to sin; that transgression comes not out of any original corruption of heart, transmitted from Adam, but out of ignorance and unbelief; that all men are formed, as Adam was, in the moral image of God; and that this image, though it may be disfigured by sin, can never be wholly lost. Faith and regeneration remove the stains and defilements of sin, and renew or reform the soul in the divine likeness. IV. They believe the new birth to be that thorough change of heart which takes place when a man, wrought upon by divine grace, forsakes his sin, or turns from his former life of worldliness and indifference toward God and the Saviour, and is drawn into fellowship with the Holy Spirit, and, thus quickened into new spiritual vitality, consecrates himself to a life of active goodness and piety. This new birth is not supernatural, but the result of appointed means suitably improved. The Holy Spirit blesses the use of these means, and moves upon the heart of the sinner, encouraging, comforting, assisting, sanctifying. They do not believe in instantaneous regeneration, though they allow that there may be a turning point in the life of every man, when his attention is specially directed to religion. Conversion is only the commencement of religious effort. V. They teach that salvation is not shelter nor safety, nor escape from present or future punishment. It is inward and spiritual, and not from any outward evil, but deliverance from error, unbelief, sin, the tyranny of the flesh and its hurtful lusts, into the liberty and blessedness of a holy life, and supreme love to God and man. This is an important doctrinal and prac-

cal point with Universalists, and is constantly enforced in their preaching and writings. They urge on all to seek salvation, not from the torments of a future hell, but from the present captivity of sin. In reply to the objection that millions die in sin, in pagan ignorance and unbelief, they answer that no one is wholly saved in this life, but that all men are saved, in a greater or less degree, after death; and assert that the power of Christ over the soul does not cease with the death of the body, but that he continues the work of enlightenment and redemption till he surrenders the kingdom to the Father, which does not take place till after the resurrection is complete. VI. The resurrection is not merely a physical but a moral and spiritual change. It is not only clothing the soul with an incorruptible body, but it is an *anastasis*, a raising up, an exaltation of the whole being into the power and glory of the heavenly; for, "as we have borne the image of the earthy, we shall also bear the image of the heavenly." It is a change, they say, by which we become as the angels, and "are children of God, being (or, because we are) children of the resurrection." It must, therefore, be something more than clothing the soul in a spiritual body. It is, beside this, growth in spiritual strength and power, in knowledge, in holiness, in all the elements and forces of the divine life, until we reach a point of perfectness and blessedness described by the term heaven. This resurrection or lifting up of the soul into the glorified life of the angels, is the work of the Lord Jesus Christ. The end of his mediatorial reign, the completion of his saving work, and the final surrender of his kingdom back to God, does not take place till after this *anastasis*, or till this uplifting of all the dead and living into "the image of the heavenly" is completed. VII. On the subject of rewards and punishments, the Universalist belief is substantially, that holiness, piety, love of God and man, are their own reward, make their own heaven here and hereafter; and that in the nature of things no other reward is possible. If men love God with all their hearts, and trust in him, they find, and are satisfied with, the present heaven which love and faith bring with them. They hold the same doctrine respecting punishment: that it is consequential, not arbitrary—the natural fruit of sin; that it is for restraint, correction, and discipline; and that God loves as truly when he punishes as when he blesses, never inflicting pain in anger, but only because he sees that it is needed, as medicine is, to prevent a greater evil. They affirm that the law is made for the good of man, and of course that the penalty cannot be such as to defeat the object of the law. Transgression brings misery or punishment, which is designed to correct and restore to obedience, because obedience is happiness. They maintain that pain ordained for its own sake, and perpetuated to all eternity, is proof of infinite malignity; but God, they say, is infinitely beneficent, and

therefore all suffering must have a beneficent element in it, all punishment must be temporary and end in good.—The Universalists believe that traces of their main doctrine may be found in the earliest Christian writings. Some of the Gnostic sects held to the final purification of those who died in sin, as the Basilidians, Valentinians, &c. The famous "Sibylline Oracles" (A. D. 150) teach explicitly the doctrine of the final restoration of the lost. As this work was written expressly to convert the pagans to Christianity, Universalists affirm that this is conclusive as to what was regarded as Christianity 50 years after the death of the apostle John. They profess to find the same belief taught in the writings of Clement of Alexandria (200); Origen (203-254); Marcellus, bishop of Ancyra in Galatia (330); Titus, bishop of Bostra (364); Gregory, bishop of Nyssa in Cappadocia (372); Didymus the Blind (370), president of the catechetical school of Alexandria; Diodorus, bishop of Tarsus (378); Theodore, bishop of Mopsuestia (394); and Fabius Maximus Victorinus (362-392). Notwithstanding that Universalism, as such, was specially and formally condemned by the second general council of Constantinople in 553, the doctrine survived, and occasionally appeared in strength; as among the Albigenses and Waldenses in the 12th century, the Lollards of Germany in the 14th, the "Men of Understanding" in the 15th, and some of the Anabaptist sects in the 16th. When the reformation began in England, this doctrine rose with it, and was defended with such zeal and success that, in preparing the "Articles of Faith" for the national church, it was thought necessary to introduce a special condemnation in an article afterward omitted. Some of the most eminent members of this church have seemed to sanction the doctrine: Archbishop Tillotson, Dr. Burnet in his *De Statu Mortuorum*, Bishop Newton, Dr. Henry More, William Whiston, David Hartley in his "Observations on Man," and others. Among the dissenters who believed and defended it were Soame Jenyns, Jeremy White, chaplain to Oliver Cromwell and author of "The Restoration of All Things," and William Law, author of the "Serious Call" and "Christian Perfection." The English Unitarians generally believe the doctrine. Universalism prevails extensively in Germany. It is freely accepted also in the French Protestant church. It began to attract attention in America about the middle of the 18th century, but it was not till the arrival of the Rev. John Murray in 1770 that it made much progress. Since that period it has spread with great rapidity. The published "Register" of the denomination for 1862 gives a United States convention, composed of 23 state conventions, in their turn composed of 87 local associations, representing 1,279 societies owning 998 churches, with a ministry of 724 preachers. They have under their patronage 11 institutions of learning, including 3 colleges and 8 academies, and support 17 periodicals. There are also various

state missionary, tract, and Sunday school societies, actively engaged in promoting the knowledge and practice of the faith. A general publishing house is in course of establishment, after the model of the Methodists. Relief funds also, for the benefit of aged and destitute ministers, are in progress, one of which, in the state of New York, already has a permanent fund of \$15,000. St. Lawrence university, N. Y., with the theological school, has property amounting to \$100,000, and a valuable library of 5,000 volumes, mostly purchased in Germany. Tufts college, Mass., opened in 1854, has funds and real estate of not less value than \$300,000, and a library of 10,000 volumes. The ecclesiastical government of the denomination is representative and congregational, the associational organizations being chiefly for mutual counsel and assistance.—See "Ancient History of Universalism," by the Rev. Hosea Ballou (12mo., Boston), and the "Modern History," by the Rev. Thomas Whittemore (12mo., Boston, 1880; new ed., vol. i., 1860).

UNIVERSITY (Lat. *universitas*), a corporation consisting of the teachers or teachers and students of one or more departments of knowledge, and other persons who have become associated with them as patrons or otherwise, which corporation has been empowered by the constituted authorities to confer degrees in one or more faculties. The term university had no reference originally to education. It is used by Cicero and other Latin writers to express the idea of completeness. In the code of Justinian it is used to designate a corporation or corporate body, as we sometimes use the word college at the present day. Thus there were in Rome in the 7th and 8th centuries "universities" of tailors, bakers, &c. Its first application to academical institutions was made in the 18th century, and grew out of this very idea of a corporation with which it had become identified. There were schools and seminaries of learning in great numbers before and after the Christian era, some of them, such as the schools of Athens, Alexandria, Edessa, and Tarsus, doubtless answering in many respects to the modern university; but none of them assumed that name, and none were in existence during the dark ages to which it could have been applied prior to the 12th century. There were indeed schools of considerable note, in most instances connected with monasteries or cathedrals, at Oxford, Cambridge, Paris, Bologna, and other cities of Europe, from the 7th or 8th century, at times flourishing, and at other times abandoned. There was also the great educational movement among the Saracens, who for several centuries had their schools deserving the name of universities, in Arabia, Syria, Persia, Egypt, Morocco, and Spain.—The university of Paris, the first distinctive university, grew out of the popularity of the lectures and teachings of William of Champeaux, Abelard, and Peter Lombard, the great masters of the scholastic philosophy,

which attracted thousands of students from all parts of Europe. The numerous schools of Paris and its vicinity, some of them connected with monasteries and others independent, taught the *trivium*, grammar, logic or dialectics, and rhetoric, and the *quadrivium*, music, arithmetic, geometry, and astronomy. Of these studies, but few went beyond the *trivium*; and those who attained the whole were regarded as prodigies of learning. (See Education.) The great influx of students rendered an organization for their government and discipline necessary, and toward the end of the 12th century they seem to have been incorporated as a body of teachers. It is probable that at first there were several of these organizations, for the faculty of arts had assumed a regular form of self-government before 1169, and in that year the rights of the chancellor of Notre Dame were exercised in reference to the faculty of theology. There are in existence two decretals of Pope Alexander III., of about 1180 and 1182, relative to the charging of fees by the chancellor for licenses to teach. The first mention of the rector or head of the university is in an ordinance of Philip Augustus in 1200, though he does not give the name of university to the organization; that was first done in 1215 by Pope Innocent III., who by his decretal of that date regulated its organization and institutions. As thus regulated all the students and professors were divided into 4 nations, viz.: the French nation, including the French, Italians, Spaniards, Greeks, &c.; the nation of Picardy, which included the N. E. of France and the Netherlands; the nation of Normandy; and the English nation, which included not only the inhabitants of the British isles and Brittany, but Germans, Poles, &c. Each nation elected a procurator (the Germans subsequently elected two, and were responsible only to them) from their own number, whose duty it was to defend the rights and privileges of the nation, convene and preside in its meetings, admit new members, and see that all the statutes were observed. Each nation had its own buildings and church and its great and small seal, was divided into provinces, and each province into dioceses, and was independent in regard to its own affairs. The 4 nations, at first voting collectively, elected a rector; but the predominance of the French nation gave so much dissatisfaction, that eventually he was elected by the 4 procurators. The rector and procurators constituted the council of the university, in which its ordinary powers of government and legislation were vested. There was however a higher officer than these, who was the fountain and source of all honor, and by whose authority alone degrees could be conferred or licenses to teach granted. This was the chancellor, who, if the university was in an episcopal city, was usually the bishop of the diocese. In Paris the university being partly in the diocese of Paris, and partly in the abbey lands of St.

Geneviève, there were two chancellors; the abbot of St. Geneviève was chancellor of the faculty of arts, while the bishop of Paris was chancellor of the other 3 faculties and of the university at large. To the 4 nations already mentioned were added in 1259 a faculty of theology, under the patronage and influence of the Dominican and Franciscan friars, and soon afterward separate faculties of medicine and canon law; and from 1281 the university consisted of 7 bodies instead of 4, viz., 4 nations and 3 faculties, represented in the government by 4 procurators and 8 deans. To the faculties only doctors, i. e., teachers, could belong; the bachelors and scholars, whether of arts, theology, law, or medicine, were still included in the 4 nations. The great influx of students led to the establishment of colleges, at first merely hostels, in which free board and lodging were furnished to a certain number of indigent students, but subsequently places of instruction also. (See COLLEGE.) They have been mostly confined to France and Great Britain. The academical degrees conferred by the universities seem rather to have originated from the necessities of the case than to have been the result of any deliberate purpose of the officers of any particular university. The term bachelor (*bachelier*) in French originally signified a young man, and was perhaps derived from *bacilla*, a little staff or stick, because the young soldiers on first entering the army exercised with small sticks instead of weapons. It was applied to those who had just passed through the curriculum of study, whether in the arts, theology, medicine, or law, because they were now to be disciplined for the actual conflict of life by practice in teaching. The terms master and doctor were originally synonymous, and both implied persons actually engaged in teaching; after a time, master was confined to those who taught the arts, and doctor to those who gave instruction in theology, medicine, or law. The title professor was given to one who professed to teach a particular subject. There was also a distinction of regents and non-regents (Lat. *rego*, to rule or instruct). The object of acquiring an education in the beginning was to be able to impart instruction, and every bachelor, master, or doctor was obliged to devote a certain period, called a necessary regency, to teaching, after which he might if he chose become a non-regent. The student in the university, at the end of 3 years, became a determiner, that is, he put himself upon repeated trials to determine whether he could become a bachelor; if he passed the examinations after 3½ years' study, he was conducted by the rector to the chancellor, who crowned and blessed him; he then assumed the round hat, and became a bachelor. After 8½ years' more study and repeated examinations, he was if found worthy presented to the chancellor as qualified to receive a license to teach the 7 liberal arts; he was then invested with the master's bonnet, and publicly and solemnly

declared a master of arts, and was at liberty to commence his career of teaching. In order however to become a full master, he must offer himself as a candidate to the company of masters of the university, to be admitted as a *socius* or fellow with them. To attain to the doctor's degree in divinity, the master must have studied 9 years, 2 of which must have been passed in the study of the Bible and 2 in Peter Lombard's "Book of Sentences." For the doctorate in law or medicine a shorter time was sufficient. The degree of doctor was conferred jointly by the chancellor and faculty, who exacted a solemn oath of the candidate to maintain their teachings and privileges.—The university of Paris was the model of most of those in France, and of the English universities. The university of Bologna can boast as early and perhaps even an earlier origin, some writers endeavoring to maintain a connection between it and a school established there in 438 by Theodosius II. and revived by Charlemagne. It would appear that the arts were taught there in the 11th century, and perhaps there may have been teachers of law also; but the university first attained prominence and its designation early in the 12th century, from the celebrity of Irenæus, the great teacher of Roman law of that century. It was the most celebrated law school of Europe for several centuries; and though it possessed other faculties, the greater reputation of its legal faculty caused them to be regarded as subordinate. In 1220 its schools were attended by 10,000 students, and in the 14th century the number had increased to 18,000. In this university the students and teachers were divided into *citramontanes*, or natives of Italy, and *ultramontanes*, or foreigners; and these were subdivided into nations, of which there were 17 in the former and 18 in the latter. Each nation had its presiding officer, called a "counsellor," except the German nation, which had instead 2 procurators. The counsellors formed the governing power of the university, and elected the rector and syndic, the former however receiving also the vote of his predecessor and of electors from the university at large. The leading distinction between the university of Paris and that of Bologna was that in the former the masters or teachers (*doctores*) constituted the privileged corporation, to the exclusion of the scholars; while in the latter students formed the university, and elected the academical officers whom the masters and teachers were bound to obey. The rector possessed more power than at Paris, and the chancellors, of whom there were two, only conferred the degrees and honors. The rector possessed supreme civil jurisdiction in all cases relating to the students, and usually might exercise criminal jurisdiction also, if he chose to do so. In 1362 there were in Bologna 4 universities: 2 of law, which however were often reckoned as one; one of medicine, the arts, and scholars of theology; and one of doctors

of theology. In Bologna originated the practice of conferring a double doctorate, of both laws, the civil and canon law, perpetuated in our degree of LL.D., and in the J.U.D. (*juris utriusque doctor*) of the German universities. The practice of paying fixed salaries to professors also originated in Bologna, where they were paid as early as 1279.—Before the year 1500 there were in Europe 64 universities, viz.: 15 in France, of which, after that of Paris, those of Montpellier, Toulouse, and Orleans were the most celebrated, the first as a school of medicine, and the last two of law; 19 in Italy, one of them, at Salerno, being probably the earliest in Europe, dating from the 10th century, though for a long time having only a medical faculty, and those of Padua, Ferrara, and Pisa also having a high reputation; 15 in Germany, the Netherlands, and Switzerland, including those of Vienna, Prague, Heidelberg, Cologne, Erfurt, Leipsic, Louvain, Basel, Ingolstadt, and Tübingen; 9 in Spain and Portugal, including Salamanca, Coimbra, Valladolid, Saragossa, and Alcalá; 2 in England, Oxford and Cambridge; one in Poland, at Cracow; one in Hungary, at Buda; one in Denmark, at Copenhagen; and one in Sweden, at Upsal.—The English universities, being founded on the model of that of Paris, present in their early history not many items of general interest. Colleges and halls were early established in both, though halls were more frequent in the former; the colleges were at first mere endowments for the support of a certain number of masters and indigent scholars; the halls were at Oxford boarding houses in which the students lived, choosing a graduate of respectable character as their principal. These hostelries were licensed by the university. About the middle of the 16th century the universities experienced their greatest depression; the number of students actually in attendance was very small, and the halls were unoccupied. From the ruin which then befell them the halls have never recovered; and it having been the policy of the heads of the university to discountenance them, there are now but 6 halls at Oxford, while there are 19 colleges, and only one hall or hostel at Cambridge, with 17 colleges. In Oxford, from the commencement of the 15th century, it was required that the students must be members of some college or hall under a responsible head. In Cambridge there has been greater liberty in this respect, and even at the present time nearly 100 of the students are not resident in the colleges. The study of Greek was not pursued at Oxford until the time of Cardinal Wolsey, who founded 7 lectureships, one of them of the Greek language. The business of teaching, originally the function of the universities, was assumed by the colleges as early as the 16th century. The organization of the universities, and their connection with the colleges, are very similar, though different names are given to many of the officers in the two institutions. (See CAMBRIDGE, UNIVERSITY OF, and

OXFORD, UNIVERSITY OF.) The university of Durham, organized in 1833, is in its main features a copy of Oxford and Cambridge in miniature. It has one college and two halls, and is under the general patronage of the bishop of Durham. Of the university of London, as embracing entirely new principles, we shall speak further on. In 1856 an act of parliament was passed which looked to a thorough reorganization of the two ancient universities, the abolition of sinecures, the greater efficiency of the teaching faculties, and the throwing open of fellowships and scholarships to general competition. The changes brought about by this law are still in progress. The Scottish universities, though not so largely endowed and comprising fewer colleges, were organized much on the Paris model, except that the students were not required to reside in the college buildings. St. Andrew's is the oldest, having been founded in 1411, and had formerly 8 colleges, St. Salvator, St. Leonard's, and St. Mary's. The first two were consolidated in 1747, and the act of parliament in relation to Scottish universities in 1858 requires that the two remaining shall be consolidated. Glasgow university was founded in 1450; that of Aberdeen in 1494, with two colleges, King's and Marischal, now consolidated; and that of Edinburgh in 1582, by James VI. of Scotland. The organization of the 4 Scottish universities is now uniform and assimilated to the new régime of the English. They are governed by a chancellor, vice-chancellor, and rector, with the 3 courts, the *senatus academicus*, university court, and general council; the first consists of the principal and faculties; the second of the rector, the principal, the lord provost of Edinburgh, and 5 assessors nominated respectively by the chancellor, the rector, the *senatus academicus*, the general council, and the authorities of the city; and the general council of the masters, fellows, and scholars. In Ireland there are two universities: the university of Dublin, or Trinity college, properly a college with university privileges; and the Queen's university, in which the colleges of Belfast, Cork, and Galway are placed under one governing board.—The French revolution broke up all the old universities of France, but left the colleges (*lycées*) in existence, and the endowments for a portion of the higher faculties. In 1808 Napoleon attempted to consolidate the entire educational system of France under one organization, which he called the university of France. The whole country was divided into 17 districts, each under its own academy, and all subordinate to the central university. Each academy had its faculties and institutions of higher instruction, embracing letters, sciences, medicine, law, and theology; its organizations of secondary instruction, consisting of imperial lyceums, communal colleges, and gymnasia; and its schools of primary instruction, answering to our common schools. This university remained till 1848, when it was merged in the "Superior (now Imperial) Council of Public In-

struction." This council consists of 33 members appointed annually, and is under the control of the minister of public instruction.—The German universities were for the most part founded on the model of that of Bologna. They concern themselves only with superior instruction, the rudiments of classical learning, or what we term the collegiate course, being pursued in the gymnasia. They all have the 4 faculties of theology, law, medicine, and philosophy, the last comprehending the subjects usually comprised under literature and science; and some of them add a 5th faculty, that of administrative and political sciences. Each university consists of two corporate bodies, the professors,

80 or 40 in number, who are paid in part by the state and partly by the students, whose attendance is voluntary, and the corporation of students. The administrative body of each university consists of a rector and senate elected by the professors. The students only attend the lectures and examinations, and do not board or lodge in college buildings.—The following table exhibits the condition in several important particulars of the European universities in 1858-'9. France has now no universities, and is consequently omitted, and the returns from Russia, Spain, and Tuscany are so imperfect that we can give little more than their names, date of organization, and number of students.

—Within a few years past efforts have been made to attach a new significance to the term university, or rather to apply it to organizations of a different character from those to which it had before been attached. The first experiment of this kind was the establishment of the university of London in 1826. It has no colleges like Oxford and Cambridge, or rather it has affiliated to it nearly all the colleges of the British empire. It has a *senatus academicus*, composed of eminent scholars of all denominations, and boards of examiners before whom the candidate for a degree is rigidly examined; if he passes these, it is of no consequence where he has acquired his knowledge. There are no degrees conferred in course, or *pro causa honoris*. Beside a matriculation examination, other examinations sufficiently strict and thorough to test the candidate's knowledge precede each degree, two being required before conferring the bachelor's degree in arts, science, law, or medicine, and those who cannot pass them are rejected without mercy. Since its organization every dissenting college, and several church colleges in Great Britain and its colonies, have sent their students to its examining boards to obtain their degrees, and a considerable number of the students of Oxford and Cambridge have preferred to pass its examinations. It has accomplished much good in rendering the educational movement freer from form and routine, and yet more thorough. There had existed for many years in England collegiate institutions founded and endowed by

dissenters for educational purposes, but which could not enjoy the privileges of the universities, and could not confer degrees upon their graduates, in consequence of their scruples in regard to subscription to the "thirty-nine articles." Lord Brougham and Thomas Campbell in 1825 attempted to remedy this by the organization of the London university (now University college), a collegiate institution which required no religious tests; but this produced some dissatisfaction, and King's college was founded by churchmen who desired to have theology included in the curriculum. Both these institutions are now dependent for their degrees on the university of London.—In the United States there are, properly speaking, no universities. Several American colleges have, indeed, connected with them more or less closely schools of theology, law, medicine, and physical science, or at least some of these faculties; but these are as often called colleges as universities, while frequently institutions of recent origin, and having a mere faculty of the arts and a course of study not above that of a well regulated high school, assume the name of university. We have no university in the continental sense of an institution in advance of the gymnasium or college, and receiving only those who have completed their course there; nor in the English sense of a corporation enclosing within it and governed and controlled by other corporations, with its fellowships, its sinecure professorships, and its ancient and peculiar traditions; nor yet after

the model of the university of London. Still, there are two classes of organizations in the United States claiming the name of university, which merit notice. The first are the state universities. In the newer states, grants of land were made by the general government for university purposes; and in Michigan, Wisconsin, Iowa, Alabama, and Mississippi, and perhaps in some of the other states, a sufficient portion of these lands has been sold to furnish a fund for the partial endowment of such universities. Though differing in minor particulars from each other, they agree in being free from denominational control, and in making provision for eventual instruction in law, medicine, physical science, and pedagogy, or the art of teaching; and they usually form the apex of a system of which common schools are the base, and which proceeds upward through the grammar school, high school or academy, and college, to the university. Much of this is yet in theory only. The other organization has but a single example as yet; it is the university of the state of New York, existing only in a board of regents, elected by the legislature on the nomination of the governor. This board has a general oversight of nearly all the colleges and academies of the state, requiring of them full and accurate reports of their professors or teachers and students, the average attendance, financial condition, studies pursued, and text books used; and certain observations on the barometer and thermometer form a part of them. They apportion to these institutions their respective shares of the literature fund, and make a full report of their doings to the legislature. They have also the power of conferring honorary degrees, though they have used it sparingly. —The British colonies have several so called universities, but they have no better claim to the title than those of the United States; in all of them, the faculty of arts is the prominent faculty, and the others, if any exist, are only of secondary importance. The Spanish-American states, both in North and South America, have universities modelled after those of Salamanca and Seville; but the teaching in most of them is not of a high order. In Brazil, the present emperor has exerted himself to improve and elevate the character of university education, calling eminent scholars from abroad to occupy the principal chairs, and introducing the latest discoveries in physical science. In Asia, the nearest approach to the university is found in China. (See CHINA, and EDUCATION.) In Persia and Hindostan there are relics of the former intellectual culture of those countries, in the now neglected universities or schools of high art. —See Du Boulay, *Historia Universitatis Parisiensis*; Anthony à Wood, "History and Antiquities of the University of Oxford;" T. Fuller, "History of the University of Cambridge," &c.; H. Malden, "Origin of Universities and Academic Degrees" (12mo., London, 1835); T. Fritz, *Esquisse d'un système complet d'instruction*, &c. (8 vols. 8vo., Strasbourg,

1840-'43); De Virville, *Histoire des universités en France* (Paris, 1847); Sir W. Hamilton, "Discussions in Philosophy" (8vo., New York, 1853); Von Raumer, "History of German Universities," translated into English by Henry Barnard (Hartford, 1859); and E. T. Rogers, "Education in Oxford" (London, 1861).

UNTERWALDEN, a canton situated near the centre of Switzerland, bounded N. by the lake of Lucerne, E. by the canton of Uri, S. by Bern, and W. and N. W. by Lucerne; area, 298 sq. m.; pop. in 1860, 24,810. It is divided into Upper and Lower Unterwalden (Unterwalden Obwalden and Unterwalden Nidwalden), the capital of the former being Sarnen, and that of the latter Stanz. A great deal of the surface is occupied by mountains, which traverse the country in different directions, and attain heights ranging between 3,000 and 10,000 feet above the level of the sea. The remainder consists of 4 principal valleys, which have a general slope toward the lake on the N. frontier, into which the chief rivers, the Melch and the Aa, discharge nearly all the drainage of the canton. There are several small lakes, and about $\frac{1}{4}$ of the area of Lake Lucerne belongs to Unterwalden. The geological formation is chalk, and the canton is remarkable for a great number of caverns. Little of the land is level enough for agricultural purposes, but the pastures are excellent, and the cattle fed upon them constitute the wealth of the country. There are extensive tracts of forests. Apples, pears, and chestnuts are raised in great quantities in the valleys, but the vine does not succeed well even in the most sheltered spots. —The inhabitants speak German, are nearly all Roman Catholics, and very few foreigners are found among them. They are exceedingly simple in their habits. Every male inhabitant over 20 years of age is entitled to a vote in appointing the principal local officers.

UPAS TREE, an utrical exogen of the natural order of *artocarpacea*, which comprises both trees and shrubs abounding in milky juices, which in some species is nutritious and wholesome, but in a few is of extreme virulence. The artocarpads are scarcely different from the utricals except in their lactiferous properties. In the genus *antiaris*, to which belongs the upas tree, the flowers are monœcious, both barren and fertile being placed in pairs side by side in the axils of the leaves, the former consisting of a 3 or 4-divided calyx, and several of them collected in a hairy involucre with fleshy involute divisions, the latter singly situated, and having a simple germen enclosed in a calyx of several divisions and surmounted by a long 2-parted style. The *bohun upas* (signifying poison tree) of the Malays, the *ipo* of Celebes and the Philippines, and *antiar* of the Javanese, is the *antiaris toxicaria* of Leschenault. It is a lofty tree, with a beautiful slender stem, which overtops the neighboring plants. It is perfectly cylindrical, rising 60 to 80 feet with-

out a branch, bears an elegant hemispherical crown, and is usually entwined with many climbers around its trunk. Its poisonous qualities are attributed to a peculiar alkaloid resident in the juice, which when freshly drawn from the tree is a bitter gum resin, of a light hue if from the young branches, and dark yellow from the older stem, but both turn black on drying. Its venomous properties can be preserved for an indefinite time if it is excluded from the air; and they so pervade the entire tree that linen spun from its tough fibres is acrid enough to produce painful itching if insufficiently prepared.—Extraordinary fables, strengthened by the narrative of Foersch, a surgeon in the Dutch East India company's service in 1774, attributed to this tree a most contagious effluvia, making the atmosphere around fatal to animal and vegetable life, and rendering the valley in which it grew a scene of desolation. When visited by Messrs. Deschamps and Leschenault, the tree was found to flourish only where vegetation was most luxuriant, the poisoned and desolate valley being situated in another part of the island, and consisting of a volcanic basin filled at bottom with carbonic acid gas. These botanists experienced no unpleasant sensations from being in its vicinity for the purpose of studying its botanical characters or investigating its structure.—There are several species of *antiaris*, of which the long-leaved (*A. macrophylla*) is found on the N. coast of New Holland, and others, whose milky juices are inert, in the tropics.

UPHAM, CHARLES WENTWORTH, an American clergyman and author, born in St. John, New Brunswick, May 4, 1802. He was graduated at Harvard college in 1821, and in 1824 completed a course of theological study at the Cambridge divinity school. The same year he was settled as colleague pastor with the Rev. John Prince of the first church in Salem. In Dec. 1844, he resigned and quitted the ministry. He next edited the "Christian Register" for a year, spent another year in visiting the counties and towns of the state as lecturer for the Massachusetts board of education, and was mayor of the city of Salem for a year. He was a member of the 88d congress (1854-'5) from the 6th district of Massachusetts, of the Massachusetts house of representatives in 1849, 1859, and 1860, and of the state senate in 1850, 1851, and 1858, and presided over that body in the last mentioned year. Mr. Upham has been a frequent contributor to the "North American Review," "Christian Examiner," "Hunt's Merchants' Magazine," Herring and Longacre's "National Portrait Gallery," and other periodicals and reviews, and, beside several occasional orations, pamphlets, &c., has published the following books: "Letters on the Logos" (Boston, 1828); "Lectures on Witchcraft, comprising a History of the Salem Delusion, 1692" (Boston, 1831); "Life of Sir Henry Vane" (in Sparks's "American Biography," Boston, 1835); "Prophecy as an Evidence of Christianity" (Boston, 1835);

and "Life, Explorations, and Public Service of John Charles Fremont" (Boston, 1856).

UPHAM, THOMAS COGSWELL, D.D., an American author, born in Deerfield, N. H. Jan. 30, 1799. He was graduated at Dartmouth college in 1818, immediately entered the theological seminary at Andover, and in 1821 became Prof. Stuart's assistant as teacher of the Hebrew language. While thus engaged he prepared a translation of Jahn's "Biblical Archaeology," which has passed through numerous editions both in this country and in England. In July, 1823, he was settled as colleague pastor of the Congregational church in Rochester, N. H.; and since 1825 he has been professor of mental and moral philosophy in Bowdoin college. In 1852 he visited Europe, the Holy Land, and Egypt. Among his works are: "Ratio Disciplines, or the Constitution of Congregational Churches" (Portland, 1829); "Elements of Mental Philosophy" (2 vols. 12mo., Portland, 1839), much on the same principles with Dugald Stewart and Reid; and "Philosophical and Practical Treatise on the Will" (12mo., New York, 1850). He has also written a series of treatises and memoirs on religious experience, differing in some respects from any other works of modern times on these subjects, and approximating in sentiment to the writings of Tauler, Gerson, and other mystics of the 14th, 15th, and 16th centuries. Their object is "to show that man, on so knowledgeable and obvious principles of philosophy and religion, can gradually but surely rise above the propensities and sins of a perverted selfhood, and not only be brought into harmony with himself in his own interior and subjective nature, but into relations of perfect peace and union with God himself and with all that is right and good in the universe." The titles of these treatises are: "Principles of the Interior or Hidden Life" (12mo., New York, 1848); "Life of Faith" (1848); "Treatise on Divine Union" (Boston, 1851); "Religious Maxims" (Philadelphia, 1854); "Life of Madame Catharine Adorna" (Boston, 1856); and "Life and Religious Opinions of Madame Guyon, together with some account of the Personal History and Religious Experience of Archbishop Fénelon" (2 vols. 12mo., New York, 1856). Beside these, he has written "Manual of Peace" (8vo., New York, 1856); "Outlines of Imperfect and Disordered Mental Action" (18mo., New York, 1840); "American Cottage Life, a Series of Poems" (18mo., Portland, 1852); "Letters, Aesthetic, Social and Moral, written from Europe, Egypt, and Palestine" (8vo., Philadelphia, 1857); and an essay, in a volume with essays by other authors on the same subject, on a congress of nations (8vo., Boston, 1840).

UPOLU. See NAVIGATORS' ISLANDS.

UPSAL, or UPSALA, a town or district of Sweden, province of Svealand, bounded N. by the gulf of Bothnia, E. by Stockholm, S. by Lake Mælär, separating it from Södermanland, and

W. by Westeras and Gefleborg; area, 2,095 sq. m.; pop. in 1858, 91,877. The sea coast extends about 90 m., and has several small indentations and the large bay of Lofta. The principal river is the Dal, on the confines of Gefleborg, and there are numerous lakes. The surface consists of undulating plains; the soil is fertile in the S., and the scenery very beautiful, but in the N. a great deal of it is barren, and the country has a bleak appearance. Iron ore is abundant, and is extensively worked, the metal produced, especially that of Danemora, being of very superior quality. Sufficient grain is raised for the consumption of the population, and considerable quantities of cattle are exported.—**UPSAL**, the capital, is situated on the Fyrisa or Sala, near its junction with one of the N. creeks of Lake Mælar, 89 m. N. N. W. from Stockholm; pop. 5,000. It stands in an extensive undulating plain about 800 feet above the level of the sea, and the river is crossed by two stone bridges. There is a large square in the centre of the town, and the streets are broad and well laid out. The cathedral, built between 1358 and 1435, is one of the finest Gothic buildings of N. Europe. It is of brick, and contains many interesting monuments, among others those of Gustavus I. and Linnæus. In former times the kings of Sweden were crowned here. The university of Upsal, founded in 1476, has faculties of law, philosophy, theology, and medicine, and is governed by a chancellor, assisted by 81 professors, and attended by nearly 1,500 students. It has a library containing about 100,000 volumes and some rare MSS., a very large collection of interesting objects of natural history, a collection of coins, a chemical laboratory, and an observatory. The society of sciences was established in 1719, and has published several valuable volumes of "Transactions." The palace of Gustavus is in a ruinous condition, but a part of it is occupied by the governor; and the house in which Linnæus lived is still standing. Upsal is the see of an archbishop, the residence of a governor, and the seat of several courts. The "Mora stones," at which the Swedes elected their kings between 1140 and 1520, lie about 6 m. S. E. from Upsal.

UPSHUR, a N. E. co. of Texas, bounded N. by Big Cypress bayou and S. by Sabine river; area, 950 sq. m.; pop. in 1860, 10,645, of whom 3,794 were slaves. The surface is nearly level and well timbered, and the soil fertile. The productions in 1850 were 90,495 bushels of Indian corn, 26,736 lbs. of butter, and 673 bales of cotton. There were 181 pupils attending public schools. Capital, Gilmer.

UPSHUR, ABEL PARKER, an American jurist and statesman, born in Northampton co., Va., accidentally killed at Washington, D. C., Feb. 28, 1844. He was graduated at Nassau Hall, Princeton, N. J., in 1807, studied law in the office of William Wirt at Richmond, Va., was admitted to the bar in 1810, and practised his profession in Richmond till 1824, when

he removed to his patrimonial residence in Northampton co. In 1826 he was appointed a judge in the general court of Virginia, in 1839 was a member of the convention to revise the constitution of the state, and after the reorganization of the judicial system under the new constitution was again elected a judge in the general court, and continued to fill that position till he was called in 1841 by President Tyler to the post of secretary of the navy. On the resignation of Mr. Webster in 1848 he was transferred to the office of secretary of state, which he filled till his death, caused by the explosion of a monster cannon on board the U. S. steamer Princeton, which he was visiting in company with the president and the other members of the cabinet. Judge Upshur published a number of essays, reviews, addresses, &c., and two more considerable works, viz.: a review of Story on the constitution, and "An Inquiry into the Nature and Character of our Federal Government."

UPSON, a W. co. of Georgia, bounded S. W. by Flint river and intersected by Potato creek; area, 884 sq. m.; pop. in 1860, 9,910, of whom 4,888 were slaves. The surface is hilly and the soil generally fertile. The productions in 1850 were 848,017 bushels of Indian corn, 68,709 of sweet potatoes, and 7,448 bales of cotton. There were 3 cotton factories, 4 grist mills, 4 saw mills, 31 churches, and 650 pupils attending public schools. Capital, Thomaston.

URAL, formerly **YARK**, a river of Russia, forming the boundary between Europe and Asia. It takes its rise in the district of Troitzk, in the Asiatic portion of the government of Orenburg, in the S. part of the Ural mountains. Its source is about 1,720 feet above the sea, and it flows at first S. past Verkho Uralak, Magnitnaya, and Kizilek, bends W. near Orak, passes Orenburg, and turning S. E. flows past Uralak, thence S., washing the base of the forts Tchegannoy, Kalmukova, and Saraitchik, and discharges its waters into the Caspian sea by several mouths, near Gurlev, about lat. 47° N. Its length is variously estimated at from 1,500 to 1,800 m., and it drains a territory of 88,200 sq. m. Its principal affluents are, on the right, the Kizil, Tanalik, Sakmara, and Bolshoy Tchegan; and on the left, the Suyunduk, Or, Ilek, Ulva, and Grashi. In its upper portion the river is obstructed by rapids, and flows through a mountainous country; lower down, it passes through wide steppes or saline plains, one of which lying between this river and the Volga is called the Uralian steppe. Toward winter the river near its mouth abounds with fish. The navigation of the Ural is of very little importance. The inhabitants upon its banks are mostly Cossacks. A line of forts has been erected along its shores as a defence against the Bashkirs and Kirgheez.

URAL MOUNTAINS, the chain of mountains forming the N. E. boundary of Europe, and separating European Russia from Siberia. Of very moderate height and breadth, the chain

would appear insignificant but for the contrast it presents to the great regions of plains that spread from its W. flank over central Russia and from its E. side into Siberia. Its course is nearly due N. and S. over an extent, as usually estimated, of 19° or 20°, with a breadth of about 40 miles. On the S. it commences on the right bank of the Ural river at the Kirgheez steppes, in about lat. 51° N.; but high lands may be traced still further S. into the region lying between the lake of Aral and the Caspian sea. On the N. its termination is at the Kara sea, or Karskaya gulf of the Arctic ocean, though its continuation is marked in the rocky hills on the W. side of Nova Zembla. The highest summit of this portion of the range, named Glasovskoy, is about 2,500 feet above the sea. The average elevation of the Ural mountains is probably less than 2,000 feet above the level of the sea, and its highest summits do not exceed 6,000 feet. Much of the range blends so gradually into the plains at its sides that it has little of the mountainous character, and is crossed by easy roads, as that by which Ekaterinburg is reached from Russia. The highest summit is said to be Deneshkin Kamen, to the N. of lat. 60°. Other principal summits are Konskakofskoy Kamen, 5,397 ft. high; Tremel or Iremel, 5,075 ft.; Constantinov Kamen, 5,000 ft.; and Taganai, 3,592 ft. It is only in the extreme northern part that the mountains remain covered with snow during the summer. In general, the chain is clothed with forests of the gigantic *pinus combra*, above which are often uplifted rugged ledges of rock of most picturesque forms, and frequently overgrown with peonies, roses, and geraniums. The rocks of which these mountains are composed, as described by Sir Roderick Murchison, resemble those of the Appalachian mountains. The lower groups are silurian strata metamorphosed into crystalline rocks, which for the most part are talcose schists, quartzites, and limestones. To these succeed the upper silurian, devonian, and carboniferous, the strata of which are also more or less altered, though still retaining traces of their characteristic fossils. A marked contrast is observed in the appearance of these rocks on the European and Asiatic slopes. On the former the strata are indeed contorted, fractured, and partially changed; while in the centre, as on the eastern slopes, the masses consist everywhere either of highly altered and crystalline silurian strata, or of the eruptive rocks which penetrate them. It is in these formations, especially where the talcose and chloritic schists are traversed by veins of quartz or cut by dikes of igneous rocks, that gold is found. In the debris from these are situated the gold washings, which furnish the chief portion of this metal and of platinum to the Russian government. (See EKATERINBURG, GOLD, and PLATINUM.) There are also important mines of iron and copper; and diamonds, emeralds, and various other precious stones are found in the same region.

URANIA, one of the nine Muses, daughter of Zeus by Mnemosyne. She was regarded as the muse of astronomy, and was usually represented with a little staff pointing at a celestial globe.

URANIUM, a metal, the protoxide of which supposed to be the metal itself, was discovered in 1789 by Klaproth in the mineral pitchblende and was named by him after the planet Uranus, which was discovered in 1781. The metal itself was not really separated until M. Pelletier obtained it in 1840 by decomposing its chloride by means of potassium or sodium. Thus produced, it is partly in the form of a black powder, and in part composed of silvery laminae which can be filed and are somewhat ductile. The metal dissolves in dilute acids, setting free hydrogen gas. In the air it undergoes no change at common temperatures; but when moderately heated it takes fire and burns with a remarkably white and shining light. So little heat is evolved, that a piece of paper upon which the burning metal is placed is not ignited. The product of its combustion is a deep green oxide. Uranium is represented by the symbol U, and its chemical equivalent is 60. In its chemical relations it resembles iron and manganese. It forms several compounds with oxygen, one of which, the black oxide ($2UO$, U_2O_3), forms about 80 per cent. of the mineral pitchblende. The sesquioxide (U_2O_3) performs the part both of an acid and a base, and is the oxide of what are known as the yellow salts of uranium. The compounds of uranium are employed chiefly in giving yellowish hues to glass and porcelain. The peculiar yellow tint with greenish or opaline reflections seen in Bohemian glass is derived from compounds of uranium. This uranium glass is remarkable for exhibiting with great distinctness the phenomenon of "epipollic dispersion of light," described a few years ago by Prof. Stokes and Sir David Brewster. These compounds are also of great value in porcelain painting, mineral pitchblende being used to a considerable extent at Joachimsthal in Bohemia, where it is converted into uranate of soda for this purpose. It produces an orange color in the enamelling fire, and a fine black in the furnace in which the porcelain is baked. The uranate of potash is of a fine orange color, and has been proposed as a paint. It is found accompanying various ores of silver and lead in several of the mining districts of Bohemia, Hungary, and Saxony. Uranium is found in a number of other minerals in combination with lime as a sulphate or carbonate; also with copper and lime; and in the hydrated phosphate of uranium and lime, known as uranite, of which the oxide forms 62.7 per cent. The lime is sometimes replaced by oxide of copper, when the mineral, in beautiful green crystals, is known as chalcocite or copper uranite. Fine specimens of these are found near Redruth and elsewhere in Cornwall.

URANUS, in Greek mythology. See CALLA.
URANUS, THE PLANET. See ASTRONOMY.

URBAN, the name of 8 popes, of whom the following are the most important. I. URBAN II. (DO OF LAENY), born in Châtillon-sur-Marne, died July 29, 1099. He was archdeacon of Reims, and afterward provost of Oluny. Gregory VII. made him bishop of Ostia, and sent him in 1084 to the emperor Henry IV. to settle the controversy respecting investitures. He was elected the successor of Victor III. in 1088, at Terracina, as the see of Rome was occupied by the antipope Clement III. Urban was at once recognized by all the Christian princes except Henry IV., who, with all the bishops of Germany but 5, sustained Clement, and the king of England, who for some time remained neutral. The antipope had to flee from Rome in 1089, and a council convoked by Urban excommunicated Clement, the emperor, and their adherents. In 1091 Clement returned, under the protection of an imperial army, and Urban fled for protection to Count Roger of Apulia; but in 1098 he once more took possession of Rome, although one of the forts remained until his death in the hands of the antipope. By his order a council at Autun in 1094 excommunicated Philip I. of France for having repudiated his wife Bertha and married Bertrada. When Conrad, a son of Henry IV., declared himself against his father, Urban recognized him as emperor. At a synod in Piacenza in 1094, he condemned the doctrine of Berengarius on the eucharist. At the council of Clermont (1095) he called on the Christian nations to deliver the holy sepulchre at Jerusalem from the Mussulmans, and thus gave an impulse to the crusades. At the council of Bari in 1098, he made a fruitless attempt to effect a union of the Greek and Latin churches. Urban was one of the most influential popes of the middle ages. He declared the election of a pope independent of the assent of the Roman emperor, vigorously enforced the law of celibacy, and forbade bishops and priests to accept ecclesiastical offices from the hands of laymen. II. URBAN V. (GUILLAUME GRIMOARD), born in the diocese of Mende, died Nov. 18, 1370. He was a member of the Benedictine order, abbot of Auxerre in 1358 and of Marcellines in 1358, and papal legate in Naples and Sicily, and was elected in 1362, at Avignon, successor of Innocent VI. He went in 1367 to Rome, but in 1370 returned to Avignon. In 1369 the Greek emperor John Palæologus himself visited Rome, abjured the peculiar tenets of the Greek church, and acknowledged the supremacy of the pope. In 1370 Urban sent missionaries to the Tartars and an embassy to Georgia, as the churches of Georgia had joined the Greek church. He was the first pope who blessed a golden rose for princes (he presented it to the queen of Naples), and the last who resided in Avignon. He was a patron of scholars, and praised by his contemporaries as entirely free from nepotism. III. URBAN VI. (BAROLOMEO DI PRIGNANO), born in Naples, died in Rome in 1389. Before his accession to the

papal see he was archbishop of Bari. He was elected successor of Gregory XI. in 1378 by the cardinals assembled at Rome; but the cardinals who were residents of Avignon did not recognize him, and in union with some of the Roman cardinals, who declared his election a compulsory one, elected Count Robert of Geneva pope under the name of Clement VII. Thus began what is known as the great schism in the Roman Catholic church. Clement was recognized by France, Scotland, Spain, Savoy, Lorraine, and Naples, and he resided in Avignon; Urban was recognized by England, the Netherlands, Scandinavia, Italy, Hungary, Bohemia, Poland, and the German emperor Charles IV. The two popes, with the aid of their allies, carried on war against each other until the death of Urban. When Queen Joanna of Naples, who had supported Urban with an army, abandoned his cause, the pope anointed Charles of Durazzo king of Naples; but soon he fell out with the latter also, and excommunicated him. Urban was besieged by Charles in Nocera, and fled in 1386 to Genoa and Lucca, but in 1388 returned to Rome. He ordered the year of jubilee to be celebrated every 33 years, instead of every 50 as before, and appointed the first for the year 1390. IV. URBAN VIII. (MAFFEO BARBERINI), born in Florence in 1568, died in Rome, July 29, 1644. Under the pontificate of Gregory XIV. he was governor of Fano, and under Clement VIII. papal prothonotary; in 1604 he was appointed archbishop of Nazareth (*in partibus infidelium*) and ambassador to Paris, in 1606 cardinal presbyter, and in 1608 archbishop of Spoleto. He was elected successor of Gregory XV., Aug. 6, 1623. He was a patron of sciences and arts, but left the government mostly to his relations, who favored France, and monopolized the most important offices. Through one of his relatives he was involved in a war with the duke of Parma in 1642, which he was obliged to conclude in 1644 by an unfavorable peace. He bestowed upon the cardinals, the three clerical electors of Germany (the archbishops of Mentz, Cologne, and Treves), and the grand master of the knights of Malta, the title most eminent (*eminentissimus*), which led to a long controversy with Venice. He condemned the doctrine of Jansenius and the system of Galileo, established the college of the propaganda, issued a revised edition of the Roman breviary, gave to the bull *In Cena Domini* its present form, and forbade priests the use of snuff in church under pain of excommunication. A volume of his poems procured him membership in the *Accademia dei Gelati* at Bologna.

URBANA, a post village and township, the capital of Champaign co., Ohio, at the crossing of the Columbus and Indianapolis and the Sandusky, Dayton, and Cincinnati railroads, 46 m. W. from Columbus and 98 N. W. from Cincinnati; pop. about 4,500. It is finely situated and well built, and has several manufactories, 2 newspaper offices, 2 banks, and a large union

school. It is the seat of Urbana university, founded in 1850 by the New Jerusalem church, and having in 1861 8 professors and teachers and 21 students in the collegiate department; and of the Urbana collegiate institute, a female seminary under the charge of the United Presbyterian church, having a large and elegant edifice with extensive grounds and 6 teachers.

URBINO (anc. *Urbium Hortense*), a fortified city of Italy, capital of the province of Urbino e Pesaro, situated on a hill, 20 m. S. W. from Pesaro, and about the same distance from the Adriatic; pop. about 7,000. It is a walled town, and has a fine government house, formerly the ducal palace, containing a collection of sculptures and antiquities; the Palazzo Albani, a cathedral, and several churches and convents. It is the see of an archbishop, and has a university, a theological seminary, and an academy of sciences and literature. It has a large manufactory of pins, and 4 annual fairs. The university was founded in 1671, and in 1860 had 20 professors and 72 students.—Urbino is a city of considerable antiquity. Pliny and Tacitus both mention it, the latter as the place where Fabius Valens was put to death in A. D. 69. Numerous inscriptions still extant prove its importance at that period. In A. D. 538 it was besieged and taken by Belisarius. After that event it continued to be a place of note, and during the middle ages was the seat of a race of independent dukes. Raphael was born here, and his house is still preserved.

URBINO E PESARO, a province of the Marche, in the kingdom of Italy, formerly a legation of the Papal States, bounded N. by Forli, N. E. by the Adriatic, S. by Ancona, Macerata, and Perugia, and W. by Perugia and the Tuscan district of Arezzo; area, 1,358 sq. m.; pop. 257,751, about equally divided between the districts of Pesaro and Urbino. The surface is mountainous. The soil, especially in the valleys, is fertile, producing various sorts of grain, flax, hemp, the olive, and the vine. The principal rivers are the Metauro, Cesano, Foglia, and Marecchia. Horned cattle, sheep, swine, bees, and silkworms are extensively reared. The province is formed from the ancient duchy of Urbino, and occupies part of the old territory of Umbria. Capital, Urbino.

URCHIN FISH. See SEA PORCUPINE.

URE, ANDREW, a Scottish chemist, born in Glasgow in 1778, died in London, Jan. 2, 1857. He was educated at the universities of Glasgow and Edinburgh, and, having taken the degree of M.D., was in 1802 appointed professor of chemistry and natural philosophy in the Andersonian institution at Glasgow. Upon the establishment of the astronomical observatory in Glasgow he was placed in charge of it, and took up his residence in the building. In 1818 appeared his first important work, a "Systematic Table of Materia Medica," with a dissertation on the action of medicines, followed in 1818 by a remarkable paper entitled "New Experimental Researches on some

of the leading Doctrines of Caloric," which was subsequently published in the "Philosophical Transactions." Within the next 15 years he published a "Dictionary of Chemistry" (1821), a translation of "Berthollet's Dyeing" (1822), a "System of Geology" (1822), and numerous papers on chemical subjects. In 1830 he removed to London, and was appointed analytical chemist to the board of customs, an occupation which suggested and supplied materials for his succeeding works. These comprise "The Philosophy of Manufactures" (1833), "The Cotton Manufacture of Great Britain compared with that of other countries" (1834), and his well known "Dictionary of Arts, Manufactures, and Mines" (1839), which has passed through several editions in America and England, the last of which, enlarged and edited by Robert Hunt, was published in 1860 (3 vols. 8vo.).

UREA. See URINE.

UREDIO, a genus of entophytous fungi resembling heaps of colored dust, and escaping from the tissues of plants by the bursting of their epidermis. Their origin was for a long time a matter of much uncertainty. The subject has been lately studied with care by Tulasne, who proved them in many instances to be rudimentary forms of other fungi and imperfectly developed conditions. The uredos are very often injurious in agriculture, species being known to the farmers as bunt, smut, burnt ear, &c., when attacking the seeds of the cereals or rust, red rag, red gum, &c., when found on the stems and leaves of grain and grasses. The subject is treated at considerable length by Burnett in his "Outlines of Botany" (London, 1885); by Prof. Henslow in the "Journal of the Royal Agricultural Society" (vol. ii. London, 1841); and by Tulasne in *Annales des sciences naturelles* (8d series, Paris, 1854). A treatise by A. C. Corda on "The Brand in Cereals," with figures of the species, has been translated for the "American Journal of Agriculture and Science," by E. Goodrich Smith, and separately published (Albany, N. Y., 1847). The several species of uredio in America, in common with like cryptogamic plants of low development of structure, are identical in many instances with those abroad.

URFÉ, HONORÉ D', a French author, born in Marseilles in 1567, died in Villefranche in 1625. He was descended from a noble family, and after leaving college entered at the head of a company of 50 men the army of Henry IV. On his return he found Diane de Châteauneuf-Morand, a rich and beautiful heiress of his district to whom he had been attached in his youth, married to his elder brother Anne d'Urfé. This couple, after living together 20 years, were divorced by mutual consent, and in order to retain the property in the family Honoré sought and obtained the hand of Diane. The lady however was so passionately fond of hunting, that she kept a large number of dogs, whom she allowed in her sleeping apartments. The insupportable smell caused by these ani-

males led him to retire to a small estate near Nice in Piedmont, where he composed *L'Astrée*. The first part appeared in 1610, the second in 1612, and two more in 1618; and after the death of D'Urfé a conclusion compiled from his manuscripts was added by his secretary Baro. The work was imitated by numerous authors, and from it a great number of subjects for dramas and paintings were taken. Beside this, D'Urfé wrote *La Syreine, avec d'autres pièces* (1611 and 1618); *Épîtres morales* (1598, 1608, and 1620); and *La sylvanire, fable bocagère*.

URFEY, THOMAS D'. See D'URFEY.

URI, a canton of Switzerland, bounded N. by the canton of Schwyz, E. and S. E. by Glarus and Grisons, S. by Ticino, and W. by Valais, Bern, and Unterwalden; area, 418 sq. m.; pop. in 1860, 14,761. It is divided into the districts of Uri and Urseren, and Altorf is the capital. The surface is exceedingly mountainous, many of the summits rising to an elevation of 8,000 feet above the sea, and several exceeding 10,000 feet. The best known, though by no means the most elevated summit, is that of St. Gothard, and the highest points are Gallenstock, Sustenhorn, Scheerhorn, Spannort, Windgelle, Bristenstock, Urirothstock, and Mutthorn. The only practicable outlets from the canton are by the road to Italy, which leads over the pass of St. Gothard, 6,700 feet above the level of the sea, and by the lake of Lucerne. Some of the head streams of both the Rhine and Rhône have their rise in Uri; but the principal river is the Reuss, which rises on the S. side of Mt. St. Gothard, receives the greater part of the drainage of the canton, and flows into the lake of Lucerne after a N. course of 30 m., during which it descends 4,500 feet. The most extensive valley lies upon the banks of this stream. It is narrow and rugged about the head, but becomes wider and level toward its lower extremity. The climate is cold, and strong winds blow from the mountains with great violence. Some grain, rape, hemp, potatoes, and vegetables are cultivated in the lower grounds, and fruit, walnuts, and chestnuts are grown. The inhabitants speak German, are simple in their habits, and almost all Roman Catholics; few foreigners are found among them. The government is a pure democracy, and every male inhabitant over 20 years of age is entitled to vote for the principal officers.

URIC ACID. See URINE.

URIM AND THUMMIM ("light and truth"), two Hebrew words, the application of which is disputed. According to one opinion, they denote the four rows of brilliant precious stones in the breastplate of the high priest, upon each of which was engraved the name of one of the sons of Jacob. When an appeal was made to God by the high priest in difficult cases, the divine answer was manifested in some way by means of this breastplate, or, in the opinion of some commentators, by an audible voice speaking to the priest arrayed in full pontificals. According to other critics, the Urim and Thum-

mim were two images personifying revelation and truth placed between the folds of the breastplate. The first time they are mentioned in the Bible, they are referred to as things already familiar to the Israelites: "And thou shalt put in the breastplate of judgment the Urim and the Thummim." (Exod. xxviii. 30.) It is unknown when this oracular method of consulting God ceased. There is no instance of it in Scripture during the time of the first temple, and it certainly was not practised during that of the second. There is a saying among the Jews that God spoke to his people during the tabernacle by the Urim and Thummim, during the first temple by the prophets, and during the second by the Bath-Kol.

URINE, the excrementitious fluid secreted by the kidneys, by means of a structure described in the article KIDNEY, transmitted slowly but continuously by the ureters to the bladder, and there retained until the distention of the organ requires its evacuation. It is secreted from arterial blood, and expelled by the agency of the abdominal muscles assisted by the contraction of the walls of the bladder, the sphincter at its opening being relaxed during the act of micturition. Its quantity varies with the amount of water in the blood, which it regulates, also removing from the body solid matters in proportion to the waste of the tissues and the surplus of azotized material in the system. The importance of this secretion is shown by the injurious effects arising from the retention of its elements in the blood, in *uræmia*, as it has been called. On account of the ease with which this secretion may be collected, both in health and disease, and the facility with which its ingredients may be separated by chemistry, its nature, purposes, and alterations are very well known. Fresh, healthy human urine should be perfectly transparent, amber yellow, with a peculiar but not disagreeable odor, and a bitterish saline taste; it contains a very small amount of pavement-epithelium cells and mucus-corpuscles, and has a well marked acid reaction; after a time it grows turbid, with a mucous sediment, unpleasant odor, and alkaline reaction from the formation of carbonate of ammonia and precipitation of the earthy carbonates; if turbid when first passed, it may be considered abnormal. The average amount, according to Prout, passed in 24 hours by a person who drinks no more than the wants of the system require, is about 80 oz. in summer and 40 oz. in winter. It is well known that the urinary and cutaneous secretions are complementary of each other, in regard to the quantity of fluid eliminated, one being increased while the other is diminished; cold, by checking the exhalation from the skin, increases the amount of urine secreted. The average specific gravity, taking the year round, according to the same authority, is about 1.020, and according to Simon 1.012. From the varying amount of azotized food and watery fluids habitually ingested, the proportion of solid

matter in the urine may vary from 20 to 70 in 1,000 parts; taking 100 parts of solid residue, the principal components are, according to different chemists, as follows:

Urea.....	38.80 to 49.68
Uric acid.....	1.40 to 1.60
Extractive matter, ammonia salts, and chloride of sodium.....	22.00 to 42.00
Alkaline sulphates.....	10.18 to 11.58
Alkaline phosphates.....	4.57 to 6.88
Phosphates of lime and magnesia.....	1.50 to 1.97

—The most important of the organic constituents of the urine is urea; this is due to the metamorphosis of the azotized components of the tissues (especially the muscular) and of the blood, and gives to the secretion its characteristic properties; the amount excreted in 24 hours in a child of 8 years is about 208 grains, in the adult female 295, in the adult male 438, and in the old man of 85 years 126 grains, the great proportion in children and the small in the aged depending respectively on the rapidity and on the slowness of the interstitial changes; it is usually increased in febrile diseases, where waste is rapid and supply small. Uric acid is the next most important of the organic products of the urine; its formation is probably anterior to that of urea; it is increased by azotized food, and diminished or converted into urea by exercise. Dr. Bence Jones has shown that there is no relation between the acidity of the urine and the absolute amount of uric acid which it may contain; this acid is sometimes in excess in febrile diseases. The acidity of the secretion in the healthy state depends on the presence of the acid phosphate of soda, though in disease free organic acids are present; it increases and diminishes inversely with the acidity of the stomach. The extractive matters, except such as are convertible into urea, are rich in carbon and poor in nitrogen. The alkaline phosphates are most abundant when, from disease or excessive use of the brain, there is a too great disintegration of the nervous tissue. The earthy phosphates, though in small proportion, are very important in reference to the precipitates they form, for which see CALCULI, GOUT, and GRAVEL. Tea and coffee diminish the amount of urea and phosphoric acid in the urine, by retarding the activity of the metamorphic processes; the waste under their stimulus being less, the demand for food is less, an important fact in a dietetic and therapeutic point of view; alcohol does the same, but by obstructing the oxidation of the excrementitious matters, and causing their retention in the blood; tobacco, also, retards the metamorphosis of the tissues, and upon this doubtless depends the instinctive craving for this article when once employed, enabling a man the better to withstand a short allowance of food. Alkalies and their carbonates accelerate metamorphosis, and thus increase the solids of the urine; diuretic medicines, which cause a larger amount of fluid to be passed off by the kidneys, do not necessarily increase, but often actually diminish, the quantity of solids thus excreted. Urine, or a fluid pre-

senting its essential characters, may pass by the gastric and intestinal mucous membranes by the lachrymal, salivary, and mammary glands, by the ears, nose, skin, and even serous membranes; these metastases are especially frequent in hysteria.—Space will not permit here any description of the diseases of the human urine, a subject of so great interest to the physician that many volumes have been devoted to it; some of the most important of them have been noticed in previous articles. When the secretion is very abundant, it may constitute either the symptom diuresis, or the disease diabetes; when painful, it is called dysuria; when suppressed, ischuria; and when drop by drop, with pain, burning, and spasmodic stranguary; in Bright's disease it is albuminuric, whence this affection has been named albuminuria; in one form of diabetes, it is highly charged with sugar; when the secretion cannot be retained, the symptom is called incontinence; very frequently the cylindrical filices and the fibrous moulds of the uriniferous tubes are detected in the fluid. Man being an omnivorous feeder, his urine differs considerably from that of purely carnivorous and purely herbivorous animals; even in him it varies much according to peculiarities of diet. In carnivora it is generally acid when discharged, becoming rapidly alkaline and ammoniacal; in herbivora it is alkaline when passed, and contains a large quantity of alkaline and earthy carbonates; in carnivora it contains about 1 per cent. of urea, is clear, bright yellow, and of a specific gravity of 1.059 to 1.076; in herbivora it is turbid when passed, from the alkaline carbonates, of somewhat lower specific gravity than in the preceding, with about 1 per cent. of urea, and hippuric acid $\frac{1}{4}$ per cent. (in the ox) to 1 per cent. (in the horse). In birds the urine is a thin paste, hardening by exposure, consisting principally of urate of ammonia, that of the carnivorous families containing a considerable amount of urea. In serpents it is a white earthy mass, consisting of uric acid with potassa, soda, and ammonia; in the bullfrog, according to Dr. John Davy, its specific gravity is 1.008, and it contains urea and chloride of sodium; in a large land tortoise, according to Marchand, it was found acid, looking like pus, with 6.40 of urea and 17.25 of uric acid in 1,000 parts.—Beside the authors quoted above, the following may be mentioned as giving information of great value: Berzelius, Bright, Becquerel, Dumas, Liebig, Lehmann, Frerichs, Golding Bird, Bernard, Dalton, and Draper.

URQUHART, DAVID, a British author and politician, born in Braclanwell, county of Carmarthy, Scotland, in 1805. In his youth he spent several years upon the continent, and then entered the university of Oxford, where he devoted his attention chiefly to political economy and the oriental languages. In 1837 he visited Greece with Lord Cochrane, after the peace of Adrianople went to Constantino-

ple, and in 1831 returned to England, publishing a remarkable work entitled "Observations on European Turkey," in which he attempted to prove that the Russian politics tended to the destruction of Turkey and the enfeeblement of other powers, especially of England, and that Turkey had within itself the elements of resistance and progress. Immediately afterward he made a long journey in Germany, Turkey, Persia, and other portions of Asia, with a view of studying the political and commercial influence of Russia. While in the East he published "Turkey and its Resources," and pamphlets entitled "England and Russia," "The Sultan Mahmoud," and "Mehemed Ali Pasha," which excited much attention by their asserted exposure of the designs of Russia. Returning to England, he labored constantly to impress his views both upon the king and the people, and in 1835 was made by Lord Palmerston secretary of legation to Constantinople. In consequence of differences of opinion with Lord Ponsonby, the British ambassador, he resigned and returned to England in 1836, and began a system of attacks upon Palmerston, whom he accused of a betrayal of British interests, and of Russian tendencies. During the following year he published "Spirit of the East" (London, 1838), "Exposition of the Affairs of Central Asia" (London, 1840), "Exposition of the Boundary Differences between Great Britain and the United States" (Glasgow, 1840), and other writings of temporary interest. When the oriental question threatened a breach between England and France, he went to Paris, and in the daily press constantly attacked the policy of the British minister, a course which injured him in his own country. While in Paris he published *La crise, ou la France devant les quatre puissances* (1840). Returning to England, he labored for some time ineffectually to get into parliament, but in 1847 was elected for Stafford. The political agitations which shortly afterward followed throughout Europe preventing any consideration of eastern questions, he undertook in 1848 a journey to Spain and northern Africa, and on his return published "The Pillars of Hercules, a Narrative of Travels in Spain and Morocco" (2 vols., London, 1850). In 1852 he was not re-elected, but continued to labor none the less earnestly to diffuse his ideas that the English ministry had a secret understanding with Russia, and was bent upon the ruin of Turkey; and his conduct became so extravagant, that he was considered a monomaniac. His partisans are now very few, and he rarely appears in public life. His latest works are: "Progress of Russia in the West, South, and North" (1853), and "Recent Events in the East" (1854).

URQUIZA, Justo José DE, ex-president of the Argentine Confederation, born in the state of Entre Rios about 1800. He is of mixed Spanish and Indian blood, and during the war which raged in La Plata attached himself to the party of Rosas, rising to the rank of general

of division. In 1840 he commanded the Argentine army which Rosas sent against Uruguay, from which his friend Oribe had been driven by Rivero. The latter finally suffered a complete defeat from Urquiza on March 28, 1845, in the battle of India Muerta, and the victorious general was rewarded with the governorship of Entre Rios. When in 1851 Rosas pretended to lay down the supreme power, Urquiza took him at his word, and a war was the consequence. The latter allied himself with Brazil, Paraguay, and Uruguay, assembled an army of 80,000 men, crossed the Parana in Jan. 1852, routed the Argentine army at Monte Caseros Feb. 3, and by a *coup d'état* made himself provisional dictator of the Argentine republic. He called a new congress at Santa Fé in August, which was to take definite steps for the settlement of the country. A revolution in Buenos Ayres in the mean time was succeeded by a counter revolution, with the aid of which he began the siege of Buenos Ayres. The defence was maintained with vigor, and by the desertion of the squadron enforcing the blockade, he was at last forced to retire. In March, 1854, he was elected for 6 years president of the 13 other states composing the union; and he employed his power in an enlightened manner, reestablishing commerce and navigation, and declaring the Parana, the Paraguay, and the Plata free to foreign powers. The war against Buenos Ayres was continued. In 1859 he mediated between the United States and the republic of Paraguay, on occasion of the La Plata naval expedition, and toward the close of that year also succeeded in bringing back the state of Buenos Ayres into the Argentine Confederation. In the following year he was succeeded in the presidency by Dr. Santiago Derqui, under whom he is now (1862) honorary commander-in-chief of the army and navy.

URSA MAJOR. See BEAR, GREAT.

URSINUS, Fulvius, an Italian scholar, born in Rome, Dec. 2, 1529, died there, May 18, 1600. He was an illegitimate son of a commander of the order of Malta, and rose to be a canon in the church of St. John Lateran. He was librarian successively to Cardinal Rainutius and Cardinal Alexander Farnese, and received an annual pension of 200 ducats. His works are very numerous, and consist of commentaries on and editions of the ancient writers, and dissertations on antiquarian subjects.

URSINUS, Zacharias, a German theologian, born in Breslau, July 18, 1584, died in Neustadt, March 6, 1683. He was educated at Wittenberg, early gained the friendship of Melancthon, went with him to Worms, and after studying at Paris returned to Wittenberg, where in 1558 he was rector of the Elizabeth gymnasium. On account of his views in regard to baptism and the Lord's supper, he became involved in controversies with the Lutheran divines, and was called the sacramentarian. In 1560 he resigned on account of these disputes, and went to Zürich, and thence

to Heidelberg, where he became a professor in the *collegium sapientia*. In 1562, by order of the elector palatine, he drew up the celebrated Heidelberg catechism, which the German Calvinists afterward adopted as the exposition of their creed. Ursinus was forced to write two defences of it, one against the Lutheran divines, and the other against the representations of the princes of the empire. He was subsequently employed in various offices by the elector, which he was obliged to give up on the death of the latter in 1577, the new elector being a strong Lutheran. He then retired to Neustadt, and taught theology and logic in the gymnasium of that city. Some of his works were translated into English. The best edition is that of Heidelberg (3 vols. fol., 1612).

URSULA, a saint of the Roman Catholic church, and, according to the legend, a daughter of a Christian prince of Britain. Having been demanded in marriage by a pagan prince, and fearing by a refusal to bring ruin upon her parents and country, she seemingly consented, but obtained a delay of 8 years, and a grant of 11 triremes and 10 noble companions, each as well as herself attended by 1,000 virgins. She passed the 8 years with her virgins in nautical exercises; and when the day fixed for her marriage arrived, a sudden wind arose at their prayer, and wafted them to the mouth of the Rhine, and thence to Basel. Here they left their vessels, and made on foot a pilgrimage to Rome. On their return they fell in unexpectedly at Cologne with an army of Huns, by whom they were massacred, Ursula having refused an offer of marriage from the prince. Their corpses were buried by the people of Cologne, and a church was afterward erected in their honor, in which bones supposed to be those of Ursula and her companions are still exhibited. The first traces of this legend, which was gradually enlarged, are met with in the 9th century.

URSULINES, a monastic order in the Roman Catholic church, founded in 1587 by Angela Merici of Brescia (canonized May 24, 1807). The foundress designed it to be only a religious association or sisterhood for nursing the sick, supporting the poor, and gratuitously instructing poor girls. Every member of the association was to be permitted to remain in the bosom of her family, and the rule might be changed according to the exigency of circumstances. Soon after the death of Angela Merici the wearing of a common dress was introduced, and 80 years later the association began to spread beyond the diocese of Brescia into other parts of Italy. Gradually the members began in many places to live together in one house, to choose superiors, and to take simple vows; in this case they assumed the name of Congregate Ursulines. The order of "Ursulina nuna," which adopted the rule of St. Augustine, and took solemn vows, was first organized in 1604 by Madeleine de Ste. Beuve at Paris, and confirmed by the pope and king in 1612. In a short time this congrega-

tion of Paris counted in France 45 houses. Other French congregations were founded at Bordeaux (1617), Dijon (1619), Lyons (1620), and elsewhere. All the Ursuline convents are placed under the jurisdiction of the diocesan bishop, and their mutual coherence is so loose, that many convents do not even know to which of the numerous congregations they belong. They have not abandoned the primary object of the original association, the nursing of the sick and the poor; but they are now mainly devoted to the instruction of girls. In 1880 they had 16 houses in Italy, 410 in France, 21 in Belgium and Holland, 37 in Germany, 2 in Switzerland, 8 in Hungary and Transylvania, 1 in Greece, 7 in the British islands, 3 in Spain, 1 in Prussian Poland, 1 in Algeria, 1 in Guiana, and 17 in North America, viz.: at Morrisania, near New York; Cleveland, Toledo, Fayetteville, and Ohio City, O.; Springfield and Alton, Ill.; Columbia, S. C.; Savannah and Augusta, Ga.; New Orleans, La.; San Antonio and Galveston, Tex.; Louisville, Ky.; St. Louis, Mo.; and at Quebec and Trois Rivières, Canada.

URUGUAY, or BANDA ORIENTAL DEL URUGUAY, a republic of South America, bounded N. and N. E. by Brazil, E. and S. E. by the Atlantic ocean, S. by the Rio de la Plata, and W. by the Uruguay, these two rivers separating it from the Argentine Confederation. It lies between lat. 30° 5' and 34° 56' S., and long. 53° 10' and 58° 20' W.; extreme length 350 m., breadth 320 m.; area, 72,000 sq. m.; pop. in 1859, 217,429. It is divided into 18 departments, viz., Montevideo, Guadalupe (formerly Canelones), San José, Florida, Colonia del Sacramento, Soriano, Paysandu, Salto, Tacuarembó, Cerro Largo, Maldonado, Minas, and Durazno. The chief towns are Montevideo, the capital, Maldonado, and Colonia del Santo Sacramento. To the N. of Cape Santa Maria the coast is low and sandy, but S. and W. of it and on the estuary of the Rio de la Plata it is more bold and broken, having several fine bays and harbors. A few small islands lie off the shore, the largest of which is about 2 m. in circumference. The most important streams of the interior are the Rio Negro and its numerous tributaries, and the Arapey, Daiman, Yaguaron, and Sebolati. In the E. part of the country there are two lakes, the largest of which lies partly in Brazil. In the neighborhood of these lakes a low sandy tract extends inland for about 50 m.; but the greater part of the surface consists of an elevated table land penetrated by many fertile valleys along the S. coast. The surface of this table land consists of extensive plains traversed by occasional ranges of low hills, the whole being almost destitute of trees. Potters' earth and amber are found, copper ore is procured near Cape Maria, and mines of gold and silver are said to have been formerly worked. The climate is remarkably mild and healthy, but during the winter months a good deal of rain falls in the

power part of the country. Severe frosts occasionally occur on the table land, but very little now falls, and cattle are consequently enabled to find subsistence at all seasons. A great deal of the land is rich and fertile, but agriculture is much neglected. Wheat, maize, barley, rice, peas, beans, flax, hemp, and cotton are all raised; and the vine, peach, sugar cane, and numerous kinds of fruit trees thrive remarkably well. Timber is only found on the banks of the principal rivers. The pastures are excellent, and the wealth of the inhabitants consists in their flocks and herds. Great numbers of horses and horned cattle run wild on the plains, and large flocks of sheep are kept, the wool of which is of superior quality. Among the wild animals are included the tapir, deer, ounce, monkey, paca, rabbit, and fox; and large packs of wild dogs frequent the plains. There are many kinds of birds, and water fowl frequent the lakes. The manufactures are of little importance, being confined to a few coarse articles for domestic use. The commerce of the country is also comparatively insignificant, few of the natural products finding their way abroad. The exports consist of jerked and salted beef, tallow, hides, horns, and hair; and the imports of manufactured articles, lumber, flour, sugar, cordage, and agricultural implements from the United States. During the year 1858, 136 vessels of an aggregate of 186,699 tons entered, and 922 vessels of an aggregate of 188,230 tons cleared from the ports of the republic. In the same year the value of the exports to the principal countries with which trade is carried on was as follows: Great Britain and her colonies, \$1,176,875; France, \$1,018,840; Brazil, \$981,880; Sardinia, \$714,425; United States, \$650,115; Spain, \$501,700; and Buenos Ayres, \$272,840.—In theory the government of Uruguay resembles that of the United States, but in practice it has degenerated into a mere military despotism, and the president, who is usually some successful general, in reality possesses absolute power. According to the budget for 1860, the revenues and expenditures for 18 months were each estimated at \$3,579,802. The total public debt in the same year amounted to about \$25,000,000.—The territory included in the republic of Uruguay was originally settled by a Spanish colony from Buenos Ayres, but the possession of it afterward caused a war between Spain and Portugal, during which it was in turn several times occupied by both. The contest was finally decided in favor of Spain, and the country attached to the viceroyalty of Buenos Ayres, and known as the district of Banda Oriental. When the war of independence began, Banda Oriental took the side of Buenos Ayres, but shortly afterward separated from that republic. The Brazilians, seeing the country in an unsettled state, and fearing lest its revolutionary doctrines should spread into their territory, took possession of it in 1821. Buenos Ayres protested against this proceeding, but war did not actually break

out with Brazil till 1826. A treaty of peace was concluded in 1828, through the intervention of Great Britain, by which the N. part of the country, known as the Seven Missions, was ceded to Brazil, and the S. portion was declared an independent state, under the title of Republica del Uruguay Oriental. Internal dissensions soon broke out, and Rosas, the president of Buenos Ayres, was asked for assistance by Oribe, one of the unsuccessful candidates for the presidency of Uruguay. Some troops were sent, and the war continued for a long time with very little advantage on either side. Brazil, being at last induced to interfere, sent to the governments of England and France to request their help in compelling the combatants to lay down their arms. Both these powers sent some ships of war to the Rio de la Plata in 1845, and blockaded Montevideo, the former till 1848 and the latter till 1849, when they made treaties with the ruler of Buenos Ayres. The Argentine provinces of Corrientes and Entre Rios joined Rosas, and the war continued till 1851, when Oribe was defeated and his patron shortly afterward deposed. Peace was now secured, and treaties were entered into with foreign states, one concluded in Jan. 1859 with Brazil and the Argentine Confederation securing the independence and neutrality of the state; but internal discord still prevailed, and has kept the affairs of the country in a most disorganized condition down to the present time. Bernardo Prudencio Berro is now president, having been elected for 4 years in March, 1860.

URUGUAY, a river of South America, which rises on the W. slope of a range of hills in the N. part of the province of Rio Grande do Sul, Brazil, about lat. 28° S., long. 50° W. After flowing N. W. for about 100 m., it is joined on the right by the Pelotas, by which name it is sometimes known in this part of its course, and then assumes a W. direction until it is joined from the N. by the Repiri, which separates Brazil from the state of Corrientes in the Argentine Confederation. Its course is now S. S. W. for perhaps 250 m., during which it receives the Ibicui, Arapey, and other important affluents, and separates Brazil and Uruguay on the left from the Argentine Confederation on the right. From the town of Belen in Uruguay, at the mouth of the Arroyo-Arapey, its direction is almost due S. for 400 m., when it unites with the Parana to form the Rio de la Plata, in lat. 34° S., long. 61° 40' W. The most considerable of all its tributaries is the Rio Negro, which joins it from Uruguay, 50 m. above its mouth. Its whole length is 800 m. It is navigable by sailing barks to a point 40 m. below the Ibicui, the N. boundary of the republic of Uruguay. There is here a cataract, above which the river is navigable by large canoes to the mouth of the Pelotas. Its banks are extremely fertile, and produce cotton and maté or Paraguay tea, but they are little cultivated.

USBECKS. See TURKS.

USES. The word *usus* was employed in the Roman civil law, and there meant a right to take so much of the fruit or profit of a thing as was needed for sustenance; while *usufructus* had a larger meaning, including a qualified right of possession. In the law of England and the United States, the word use has a precise meaning, which is similar to that of the *fidei commissum* of the Roman law. It means a confidence reposed in one who has the property (or to whom it is given) in possession, that he will hold it for the use or benefit of another, who is called in Norman French the *cestuy que use*. A Roman magistrate (a prætor) was charged with the enforcement of these *fidei commissata*, and was called *commissarius*. When uses became common in England, the chancellor, under whose jurisdiction they passed, had much the same duty to perform as the Roman *commissarius*; and indeed Lord Bacon calls this magistrate a Roman chancellor.—Uses were invented in England to avoid and defeat the statutes of mortmain (see *TAVER*); and to protect those statutes against uses, the statute of 27 Henry VIII., commonly called the statute of uses, was enacted. This statute provided that any person or corporation entitled to a use in fee simple, fee tail, or otherwise, should stand seized and possessed of the land itself, in the like estate which they had in the use; the intention being to subject a conveyance to the use of any one, and the property and the *cestuy que use*, to the same legal restraints and liabilities as if the conveyance had been made directly to the *cestuy que use*. This statute was said, in legal phraseology, "to execute the use." It was intended to prevent conveyances to use, by making them of no effect where they violated the statutes of mortmain, and of no more effect than a direct conveyance where they did not. Still such uses as the law permitted, or as courts of equity could protect, were found to be exceedingly convenient, and became common; and courts of equity retained their hold upon them, the person to whom the conveyance was made being considered as having the legal estate, subject to the rules of law and the jurisdiction of courts of law, while the *cestuy que use* has an equitable estate subject to the rules and the courts of equity. This is now the prevailing condition of the law of uses in England and in the United States. But the whole system of law and of equity in regard to uses has become as intricate and extensive as it is important. Here we can do no more than indicate the principal rules of this system.—There can be no use, unless: 1, there is a person capable in law of taking it; 2, a person capable in law of being seized of the property to the use of the other; 3, an express declaration of use, or a consideration and a transfer or contract from which the court will imply a use; and 4, sufficient estate or property or interest to sustain a use. Then, if a use exists which the courts can recognize, it is descendible, or heritable, or devisable, or transferable accord-

ing to the rules of law or equity, in conformity with the provisions in the instrument creating the use. If the *cestuy que use* of land be married, his widow has no dower, nor the husband of a *cestuy que use* a tenancy by courtesy, because the *cestuy que use* has no seisin, nor can he bring an action at law respecting it. The seisin is in the feoffee-to-use, and while his legal estate is subject to all legal incidents at law, equity will subject all these legal incidents to the equitable requirements of the use.—Trusts and uses are often spoken of together, and from the article on *TRUSTS* their similarity, or analogy, will be seen. They are however different in important particulars; but the rules of law which define this difference are so nice and technical, and still open to so much question, that our space does not permit us to present them with sufficient fulness to be useful.

USHANT (Fr. *Ouessant*), the chief island of a cluster of 7, known collectively as *Îles d'Ouessant*, situated about 15 m. from the coast of France, off the W. coast of the department of Finistère, of which they form a canton, and 28 m. W. N. W. from Brest; extreme length 5 m., breadth 3 m.; pop. 2,271. The shores of Ushant are bold and rocky, and landing is only practicable in a few places. The formation is almost entirely granitic, and the soil is fertile, the surface being covered with excellent meadows and pasture lands, upon which horses and sheep are reared. The inhabitants are principally occupied in fishing, and paganism was said to linger among them till the 17th century. The lighthouse on Ushant is situated in lat. 48° 28' N., long. 5° 8' W. Off Ushant the British fleet under Sir Edward Hawkes gained a complete victory over the French under Admiral Conflans in 1759; and an indecisive action took place between the English under Admiral Keppel and the French under Count d'Orvilliers in 1778.

USHER (Fr. *huissier*), a public officer having charge of the door of a court or hall, and hence one whose business it is to introduce strangers and perform other similar duties. There are various officers of this kind attached to the royal household in England, including the gentleman usher of the black rod, who attends in the house of peers during the sessions of parliament, and 12 or more gentleman ushers. There is also an usher of the exchequer, who attends the barons and other officers of that court. The term is also applied to an under or assistant master in a school.

USHER, JAMES, an Irish prelate, born in Dublin, Jan. 4, 1580, died in Reigate, Surrey, March 21, 1656. He was educated at Trinity college, Dublin, being one of the first 8 students admitted. He began the study of theology in 1598, took the degree of M.A. in 1600, was ordained priest in 1601, and soon after received the appointment of "Sunday afternoon preacher before the state" in Christ church, Dublin. He was chosen professor of divinity in his college in 1607, and in the same year was made chancellor of the cathedral of St. Patrick. In 1620

King James nominated him to the see of Meath; in 1628 he was made a member of the Irish privy council; and in Jan. 1624, he was raised to the archbishopric of Armagh and the primacy of the Irish church. In 1640 he visited England, and during his absence his house at Armagh was destroyed by the rebels (1641), and with it he lost nearly every thing he possessed. In the state of the country it was thought needless to return to his archbishopric, and Charles I. conferred upon him the bishopric of Carlisle, to be held *in commendam*. In 1647 he was chosen preacher to the society of Lincoln's Inn, and preached regularly in the chapel during term time for nearly 8 years. He was buried in Westminster abbey by order of Cromwell. His principal works are: *De Ecclesiarum Christianarum Successione et Statu* (London, 1613); "Emanuel, or a Treatise on the Incarnation of the Son of God" (Dublin, 1638); *Britannicarum Ecclesiarum Antiquitates* (Dublin, 1639); *De Romano Ecclesia Symbolo* (London, 1647); *Dissertatio de Macedonum et Asianorum Anno Solari* (1648); *Annales Veteris et Novi Testamenti* (8 vols. fol., 1650-'54); *Epistola ad Ludovicum Capellum de Variantibus Textus Hebraici Lectionibus* (1652); "The Reduction of Episcopacy to the Form of the Synodical Government in the Ancient Church" (1658); and *Chronologia Sacra* (1660). A complete edition of his works has been published by the Dublin university in 17 vols.

USQUEBAUGH (Irish, *uisge*, water, and *b-igh*, life), the Irish name for distilled spirit, whence the modern word whiskey. It is now applied to a liquor compounded of brandy, raisins, cinnamon, and other spices.

USUMASINTA RIVER. See GUATEMALA.

USURY. Originally this word meant any taking of money for the use of money; and he was therefore a usurer who, lending money, required in repayment any thing more than the amount which he lent. This was once considered a great moral wrong, and the greater the more was taken. For many ages, however, this opinion, if it has not ceased to exist, has lost much of its practical or legal force. It is no longer deemed more wrong to take pay for the use of money than for the use of a house, or a horse, or any other property. But the lingering influence of the former opinion, together with the fact that the nature of money makes it easier for the lender to oppress the borrower, has caused nearly all Christian nations to fix by law the rate of compensation for the use of money. If compensation be taken within this limitation of law, it is called interest; but if more be taken than the law allows, this is, in the present meaning of the word, usury. (See INTEREST.) The opinion that money should be borrowed and repaid, or bought and sold, upon whatever terms the parties should agree to, like any other property, has of late years gained ground almost everywhere; and where usury laws are in force, this opinion has perhaps exerted some influence upon adjudication. In

England, in the reign of Henry VIII., interest at 10 per cent. was made lawful; in the time of James I. it was reduced to 8 per cent.; during the commonwealth it was 6 per cent., and this was again enacted by 12 Charles II.; the statute of 12 Anne reduced it to 5 per cent. The act 8 and 4 William IV. exempted from the operation of the usury laws bills having more than 8 months to run. After several modifications in the reign of Victoria, the act 17 and 18 Victoria, ch. 90, repealed all laws then in force relating to usury; providing only that the rights and remedies of persons in respect to acts previously done, should not be affected by the statute.—In the United States, the usury laws differ in different states, and are not perhaps precisely the same in any two. In Louisiana 5 per cent. is the legal rate; in New York, South Carolina, Georgia, Michigan, Wisconsin, and Minnesota, it is 7 per cent.; in Alabama, Florida, and Texas, 8 per cent.; in California, Kansas, and Oregon, 10 per cent.; in all the other states it is 6 per cent. But the statutes vary exceedingly as to the legal effects of usury. In some, the parties may agree on what rate they will, and the legal rate takes effect only in the absence of agreement; in others, the whole contract is avoided by a reservation or agreement for more than the legal rate. Regarding these as extremes, in much the greater number the penalty for usury lies between them. In some states the legal rate takes effect when there is no agreement, but the parties may agree for more up to a certain definite limit.—There are many ways in which the usury laws may be evaded, and courts watch contracts liable to this abuse with great strictness. Some principles may be gathered from the adjudications, which may be regarded as prevalent, if not universal. Thus, to constitute usury, there must be substantially a loan, and a usurious intent in both parties, in one to give and in the other to take usurious interest. But the contract need not be, in form, a loan; and whether it is so in fact, is a question for a jury. Property may be sold for whatever price the parties agree upon; but if the sale be in fact a mere cover for the usury, it does not protect it. Negotiable paper may be sold like other paper. The cases on this subject are numerous, nice, and perhaps conflicting; but it may be stated as a general rule, that if it is in fact the promisor who sells, and the buyer buys even through an agent, but with knowledge that he buys of the promisor, it is in fact and in law a loan from the buyer, and may therefore be usurious. Even if a statute declares a usurious contract "void," in the most emphatic language, the law looks upon it rather as "voidable;" and therefore no one can make the objection of usury but the borrower and the parties in privity of interest and contract with him. So, if one borrows stock, agreeing to replace it with the dividends received in the mean time, or if he agrees to replace it, or the money it sells for, with interest

on its value, the contract is not usurious; but if the lender retains an option to take either the dividends or interest, it is usurious. If a note be given usuriously in payment of or as security for a preëxisting debt, and the note is void by the usury laws, the original debt remains unaffected. As there must be usurious intent, if illegal interest is taken by a miscalculation or other mistake in fact, it is not usury; but it is usury if the mistake be one of law, because every person is held to know the law. If the lender takes upon himself an extra risk (apart from that of the borrower's insolvency), he may charge extra interest. Bottomry and respondentia contracts are founded on this principle, because if the ship or goods are lost, the debt is not demandable. The same principle is applied to the purchase of an annuity, and even to the bargain of the borrower that if he does not repay the principal when due with legal interest, he will pay a certain penalty, because he has the power of avoiding this penalty by payment of interest. If a borrower on repaying the money make the lender a gift, it is usurious if the gift be in performance of a previous promise, but not otherwise. Discount of interest, whereby the lender gets interest on his interest, or interest on money which he never lends, and calculations of interest by Rowlett's tables, which consider the year as consisting of only 360 days (but qualify the error by casting the fractions on the right side), are now established usages, and would not make the contract usurious, especially if the contract were of a kind usually subjected to this usage, as are bank discounts. Compound interest is said, in a recent case (23 Pick. 167), to "savor of usury;" but it may be regarded not so much usury as an agreement to pay a penalty for not paying interest. In the present state of the authorities, it may be said that wherever usury is forbidden, a bargain for compound interest would not be enforced. But it is common for courts to order a settlement of accounts with annual rests, which is equivalent to compound interest. This is especially done where trustees have used the money of their *cestui que trust*. The prevailing rule for the settlement of accounts on which payments have been made (originating in a decision in Massachusetts) is this: compute the interest on the principal to the first time a payment was made, which payment exceeds, alone or with previous payments, the interest then due; add that interest to the principal; from the sum subtract the payment and preceding payments; the remainder forms a new principal, upon which proceed as before, up to the time of settlement or the rendering of judgment.

UTAH (from the Indian tribe of the same name, commonly spelled Yuta, which signifies "those who dwell in mountains"), a territory of the United States of America, bounded N. by Washington territory, N. E. by Nebraska, E. by Colorado, S. by Arizona (New Mexico),

and W. by Nevada, and lying between lat. 37° and 42° N., and long. 109° and 116° W.; area, 181,820 sq. m., or 84,044,880 acres. It was divided in 1860, according to Capt. R. F. Burton ("City of the Saints," 1863), into 19 counties, viz.: Salt Lake, Utah, Davis, Weber, Iron, Tooele, San Pete Valley, Juab, Box Elder,* Washington, Millard, Green River, Cedar,* Malad,* Cache,* Beaver,* Shampip,* Salt Lake Islands,* and St. Mary's.* The largest town is Salt Lake City, Fillmore, the capital being only a hamlet; and the other county towns are Provo, Farmington, Ogden, Parowan, Tooele, San Pete, Salt Creek, Box Elder, Fort Harmony, Fort Supply, Cedar City, Fort Malad, Cache Valley, Beaver Creek, and Deep Creek. The population of the territory by the U. S. census of 1850 was ascertained to be 11,380, of whom 26 were slaves. In 1856 a census taken by the Mormon authorities returned 87,277 males and 39,058 females, a total of 126,335. The non-Mormon inhabitants, however, maintained that these numbers were purposely exaggerated, and the U. S. commissioners in the following year reported that the population did not exceed 50,000. The U. S. census of 1860 returned 40,295, of whom 29 were slaves. A majority of the people are foreigners, chiefly from Great Britain.—The surface of Utah is an immense basin elevated 4,000 to 5,000 feet above the sea, surrounded on all sides by mountains 8,000 to 10,000 feet high, and subdivided by transverse ridges. The rim of the basin is formed on the N. by the mountains of Oregon, on the E. and S. by sub-ranges of the Rocky mountains, and on the W. by the Sierra Nevada. At some remote period this great basin was evidently an inland sea. The bench formation, a system of water marks, is found in every valley, while detached and parallel blocks of mountain, trending almost invariably N. and S. were in geological ages rock islands rising above the water. Between these primitive and metamorphic ridges lie the secondary basins, whose average width may be 15 or 20 miles. They open into one another by cañons and passes, and are often separated longitudinally by smaller divisions running E. and W., thus converting one extended strip of secondary into a system of tertiary valleys. Two great mountain chains run transversely across the basin from S. E. to S. W. The northernmost is the Humboldt river range, 6,600 feet high; the southern is the prolongation of the Wahsatch range, which has an elevation of nearly 12,000 feet. The watershed of the basin is toward the N. S., E., and W., chiefly through the affluents of the Columbia and the Colorado. Lakes are numerous, two nearly parallel chains of them extending across the country from N. to S. The eastern chain begins at the north with the Great Salt lake (see GREAT SALT LAKE), the small lakes of the Wahsatch, the Utah, the

* These counties are not contained in the U. S. census returns for 1860; while three returned by the census, Carson, Decret, and Summit, are not named by Burton.

Nicollet, and the Little Salt lake. All these are fed by the streams that flow from the western counterslope of the Wahsatch mountains. The other chain consists of Mud, Pyramid (so called from a pyramidal rock rising from its waters), Carson, Mono, and Walker's lakes, which receive the waters flowing from the eastern slope of the Sierra Nevada. There are many thermal springs in the territory, some of which discharge strong brine, some are sulphurous, and others chalybeate.—The rocks of Utah are mostly primitive—granite, jasper, syenite, hornblende, and porphyry, with various quartzes. Volcanic action is indicated by the presence of obsidian, scoriæ, and lava. Many of the ridges are of carboniferous limestone mingled with calcareous spar, and resting upon or alternating with hard and compact grits and sandstone, and in many places rich with encrinurites and fossil corallines. In the cañons near Salt Lake City are found bowlders of serpentine; fine gray granite; coarse red, ochrish, poikilitic, crystalline white, and metamorphic sandstones; a variety of conglomerates, especially granitic, with tufa in large masses; talcose and striated slates, gypsum, pebbles of alabaster, and various kinds of limestone. Marble of every hue and texture is found in large masses. Iron of excellent quality is abundant, and gold, silver, copper, lead, and zinc have been found. Bituminous coal exists in inexhaustible quantities, as also sulphur and saleratus; and alum, borax, and petroleum have been discovered. Among the precious stones that have been found are rubies, emeralds, chalcedony, sardonyx, carnelian, and agates.—Among the native animals are the antelope, deer, elk, bighorn or Rocky mountain sheep, the cougar, the catamount, the large and small wolf, the red, great-tailed, and silver fox, minks, ermines, skunks, badgers, wolverenes, beavers, hares, the jackass rabbit, porcupines, gophers, woodchucks, squirrels, and the hyrax, or as the Mormons call it the cony. The principal birds of prey are the red-tailed hawk, the sharp-shinned hawk, the sparrow hawk, and the vulturine turkey buzzard. There are several varieties of quail and grouse; and among the water fowl are swans, wild geese, the white pelican, the cormorant, the mallard or green-head, the red-breasted and green-winged teal, the brant, the plover and curlew, the gull, a blue heron, and a brown crane. There are also the blue bird, the humming bird, finches, woodpeckers, the swamp blackbird, the snow bird, and a species of lark which is considered a delicacy for the table. Among the reptiles are a gray and green lizard and the *phrynosoma* or horned frog, of which there are many species. The serpents are chiefly rattlesnakes, swamp adders, and water snakes. The fishes are perch, pike, bass, chub, trout, and salmon trout, the last of which sometimes reaches the weight of 80 lbs.—The vegetation of Utah is not luxuriant. Timber is scarce except on the mountains, where there are extensive forests of pine and fir. The lower cañons

and river bottoms produce willows, scrub maple, box alder, aspen, birch, cottonwood, and in the southern part of the territory spruce and dwarf ash. There is an inconvenient deficiency of hard wood and of wood fit for building, though extensive plantations have been made which promise a sufficient supply in the future. Among the peculiar natural products is a fine bunch grass, which lives and grows through the winter and furnishes food for cattle at all seasons. The wild fruits are the service berry, chokeberry, buffalo berry, gooseberry, strawberry, and black, white, red, and yellow mountain currant.—The great elevation of Utah above the sea and the immense masses of snow-covered mountains that surround it exercise a material effect upon the climate. The air is highly rarified, so that new comers suffer from difficulty of breathing, and after violent exercise experience nausea and fainting. The weather is changeable, and during much of the year is very bleak. In 1860 the highest range of the thermometer was 96° in July, and the lowest 22° below zero in December. Spring opens in the valleys with great suddenness, and the summer is hot, though the mornings and evenings are usually cooled by breezes from the mountains. Thunder storms and dust storms are frequent and violent. The winter is severe, with high winds and deep snows, which lie in the cañons throughout the year.—The Indians of Utah are chiefly of the Shoshonee or Snake nation, and of the Yuta or Ute race, as they are commonly called by the whites. The Shoshonees comprise 14 tribes, averaging nearly 1,000 souls each. The Yuta are divided into 27 bands, and are estimated to number 15,000 souls. Many of their bands however roam beyond the bounds of Utah, and the whole nation is thought to be diminishing. Of late years they have been hostile to the whites, and have lost many of their fighting men in encounters with the emigrants crossing the plains to California, and with the U. S. regular forces. Of the white inhabitants of Utah, nearly all are Mormons or "Latter Day Saints," the majority of whom are of European birth, chiefly English. The character of these people, among whom polygamy is extensively practised, has been very differently represented by different observers. By most of the travellers who have written concerning them they have been described as intolerant, ignorant, immoral, and coarse, with little regard for the rights of the "Gentile" or non-Mormon part of their neighbors. On the other hand, Capt. Burton, the English traveller, who spent 24 days among them in 1860, and is an apologist for polygamy, says that "in point of mere morality the Mormon community is perhaps purer than any other of equal numbers," and ascribes to them tolerance, kindness, sobriety, industry, and many other good qualities. The influence of the priesthood is very strongly felt in all civil and social matters among the Mormons, and is exercised through a complicated and imposing or

ganization of presidents, bishops, elders, quorums, and councils. A regular system of tithing has been instituted, by which one tenth of the grain, beef, pork, butter, and other products of labor is given by the people to the church. There is a tithing office at Salt Lake City, in which the goods thus contributed are received and stored, and in which accounts are kept with every member of the church. The amount of the produce of each is carefully ascertained, and he is charged with one tenth of every thing, including his labor, and credited with what he pays. Branch offices are kept at the principal villages and settlements, from which reports are made.—The soil of Utah is in general hard, dry, and barren. Not more than one fiftieth part is fit for tillage, though in some places extraordinarily large crops have been raised. It is said indeed that land near Lake Utah has yielded from 60 to 100 bushels per acre. The principal crops are wheat, buckwheat, oats, barley, Indian corn, all the fruits and vegetables of the temperate zone, and flax, hemp, and linseed in abundance. The warmest and most fertile lands are on the benches above the lower valleys. The alkaline nature of the soil is injurious to vegetation, though potatoes, squashes, and melons are made sweeter by a small admixture of it. A species of cricket, and a grasshopper about the size of a common locust, are also very troublesome to the farmer. The difficulties which beset agriculture do not extend to grazing, for which the country is admirably adapted. The valleys supply plentiful pasturage in the winter, and as spring advances, and the snow disappears on the hills, the flocks and herds find ample forage on the bunch grass, which bears its seed in summer. In the basin of Green river is a fine wool-producing region nearly as large as Massachusetts, and the best breeds of sheep have already been introduced into the territory. In 1860 the valley of the Great Salt lake produced 806,000 bushels of grain, chiefly wheat, which thrives better than maize, the summers being scarcely long enough for the latter grain.—The manufactures comprise farming implements, agricultural and other machines, steam engines, leather, woollen and cotton goods, dye stuffs, furniture, cutlery, hardware, jewelry, and brushes. These works are carried on for the most part by skilful English artisans. There are some distilleries and 8 or 10 breweries, in which beer is made from wild hops. The great distance of Utah, both on the east and the west, from the settled parts of the country, and the difficulties of transportation over the mountains, render almost every article of commerce not produced in the territory itself exorbitantly dear. Groceries and clothing are particularly high-priced. Sugar is worth from 37½ to 40 cents per pound, coffee 50 cents, and tobacco \$1.—Education is superintended by a chancellor and board of regents of the "university of the state of Deseret." Common schools are established in each ward of Salt Lake City. There are also various insti-

tutions of a higher order, of which the most flourishing is an academy founded in April, 1860, in which science and art are to be taught gratis to all who pledge themselves to learn thoroughly, and to benefit the territory by their exertions. There are two weekly newspapers in the territory, of which the "Deseret News," established in 1850, is the recognized organ of the church. The other is a secular paper called "The Mountaineer."—Utah is organized like the other territories of the United States, with a governor, secretary, marshal, and judges appointed by the president, and a legislative assembly elected by the people. Legislative action is not dissimilar from that of other territories, except that no punishment is affixed to bigamy. There was no national law against this offence until 1862, when congress passed an act "to punish and prevent the practice of polygamy in the territories of the United States and other places, and disapproving and annulling certain acts of the legislative assembly of the territory of Utah."—For the history of Utah, see *Mormons*. The inhabitants of the territory have recently adopted a constitution and government under the title of the state of Deseret, and their senators and representatives in June, 1862, unsuccessfully applied to congress for admission.

UTAH, an E. co. of Utah territory, bordering on Colorado territory, and drained by White, Green, and Uinta rivers; area, about 4,000 sq. m.; pop. in 1850, 2,026. Utah lake, 40 m. long and from 5 to 12 m. wide, lies in the W. part, which is also traversed by the Wahsatch mountains. Most of the surface is hilly. The soil in the valleys is productive, and in the hilly parts sterile. Capital, Provo.

UTICA, a city and one of the capitals of Oneida co., N. Y., situated on the Mohawk river, and at the junction of the New York central and Utica and Black River railroads, and of the Erie and Chenango canals, 86 m. W. N. W. from Albany, and 86 m. E. from Syracuse; pop. in 1860, 22,528. The city lies on the S. side of the Mohawk, and is regularly laid out; it rises gradually from the river to the height of 150 feet at the head of Genesee street. This street has the principal shops and many elegant private residences. The city hall on this street, erected about 1852, is of Milwaukee brick, and contains beside the city offices a court room for the U. S. district court, and a commodious public hall. The city is lighted by gas, is well supplied with water, and has a very efficient fire department. It has 6 large and several smaller hotels; 4 banks, with an aggregate capital of \$1,310,900, and 2 savings banks; a cotton mill, employing 350 hands, consuming 8,000 bales of cotton, and producing 8,400,000 yards of cotton cloth annually; 2 woollen factories, employing 430 hands, and consuming nearly 900,000 lbs. of wool annually; a millstone and plaster mill, producing about \$60,000 worth annually; and numerous manufacturing factories of starch, flour, ale, clothing, organs,

pianos, castings, machinery, carriages, boats, stone wares, fire brick, carpets, oil cloths, &c. There are 24 churches, viz.: 4 Baptist, 8 Methodist Episcopal, 3 Protestant Episcopal, 3 Roman Catholic, 2 Presbyterian, and 1 each Evangelical, Evangelical Lutheran, Calvinistic Methodist, Reformed Dutch, German Methodist, Wesleyan Methodist, Old School Baptist, and Universalist, and a Jewish synagogue. There are 11 newspapers and periodicals published in the city, of which 8 are daily and weekly, 4 weekly, 3 monthly, and 1 quarterly. Two of the newspapers are Welsh and one German. The public schools are graded, and in 1861 employed 7 male and 88 female teachers, and were attended by 8,108 pupils. The total expenditure was \$22,745. The number of volumes in the district school libraries was 3,018. There were beside these 10 private schools, the Utica female academy, a flourishing institution founded in 1837, and the academy of the Assumption, under the care of the brothers of the Christian schools. Utica is the seat of the state lunatic asylum, one of the largest insane hospitals in the United States, which on Nov. 30, 1861, had 382 patients. The asylum occupies a farm of 180 acres, and the cost of the buildings has been upward of \$500,000. There are also a Catholic and a Protestant orphan asylum; the former, under the care of the sisters of charity, maintains from 50 to 90 orphans, and the latter, incorporated and endowed, from 75 to 100.—The site of the city was included in the colonial grant styled Cosby's manor, made in 1734; but there was no settlement till after the revolution. In 1787 there were 3 log huts in the place. Fort Schuyler had been erected between the present Main and Mohawk streets, below Second street, in 1758, and occupied as a military post, and a blockhouse was built before the close of the revolutionary war on the site of the present railroad depot. In 1813 it had 1,700 inhabitants, and it grew very slowly till after the completion of the Erie canal.

UTIOA, an ancient city of Africa, situated on the W. arm of the river Bagradas, near the bay of Carthage, a little N. W. of the present city of Tunis; its site is now occupied by the little village of Duar. It was founded by the Tyrians, 287 years before the foundation of Carthage. In the early wars between Rome and Carthage it appears as an ally of the latter. In the 3d Punic war it made a separate and early submission to Rome, and its prosperity was thereby greatly increased, as on the fall of Carthage a part of its territory was given to Utica, and that city made the capital of the colony and the residence of the Roman governor. In the historical narratives of the struggles between Sylla and Marius, and those between Cæsar and Pompey, frequent references are made to it as a place of great importance. Its temples and statues; its amphitheatre, capable of seating 20,000 persons, and where on an artificial lake mimic sea fights were exhib-

ited; its aqueduct, bringing water from hills several miles distant, and carrying it by triple arches over the ravines; its numerous vast reservoirs, or cisterns, some of which still remaining are 136 feet long, 19 wide, and 20 or 30 deep, all indicate its magnificence in the period of its greatness. Cato the younger, surnamed Uticensis, committed suicide here in 46 B. C. Augustus made it a free city. Hadrian persuaded the inhabitants to become a Roman colony. Septimius Severus bestowed upon it the *jus Italicum*. It was the see of a Christian bishop at an early date. It fell into the hands of the Vandals in 489, but was recovered by the Byzantine emperors, who retained it till the reign of the caliph Abd-el-Malek, when it was conquered by the Arabians, and was destroyed about the close of the 7th century.

UTOPIA (Gr. *ou*, not, and *topos*, a place), the title of a political romance by Sir Thomas More, and the name that he gave to an imaginary island, which he represents to have been discovered by a companion of Amerigo Vesputci, and in which existed a perfect society. He pictured a community where all the property belonged to the government, to which every one contributed by his labor, receiving therefrom a supply of his wants; where the citizen rose through all the gradations of his existence from form to form, as if in a vast public school; where gold was contemned, and all the members of the society, unswerved by passion, were fixed each in his proper place. The "Utopia" of More was published in Latin in 1516, and was translated into English by Bishop Burnet. The name is applied to all narratives of an imaginary perfect society, as the republic of Plato, the solar city of Campanella, the "Oceana" of Harrington, the floating isles of Morelli, and the happy nation of Felicians of Mercier de la Rivière; and also to socialist speculations like those of Babeuf, Saint Simon, and Fourier.

UTRECHT, a province of Holland, bounded N. by North Holland and the Zuyder Zee, E., S., and W. by Gelderland and South Holland; area, 534 sq. m.; pop. in 1860, 161,164. The chief towns are Utrecht, the capital, Amersfoort, Rhenen, Wyk, Montfoort, and Ysselstein. The surface is level in the N. and W., and varied in the S. E. by some low hills. It is well watered by the Rhine, and its branches the Vecht and Amstel. The air is not so damp as in other parts of Holland, and the climate is generally healthy. In the more elevated parts of the province the soil is sandy, and is covered by extensive heaths and tracts of peat moors; but the low ground is remarkably rich and fertile.—UTRECHT, the capital, is situated on the Old Rhine, at the bifurcation of the Vecht, in lat. 52° 7' N., long. 5° 6' E., 22 m. S. E. from Amsterdam; pop. in 1859, 58,083. The site is comparatively elevated, and the town is traversed by 2 canals which are crossed by numerous stone bridges. It is of oval shape, about 3 m. in circuit, and was formerly surrounded by walls, but these have been removed and the

ground occupied by beautiful walks, outside of which is the Mallébaan, a promenade and carriage way planted with several rows of shade trees, and bordered by fine gardens. The most remarkable building is the ancient cathedral, erected in 1882 and now in a dilapidated state. It has a detached tower, said to be 388 feet in height. There are several other churches, 8 of which belong to the Jansenists, who have their chief establishment here. The old town hall contains the room in which the first confederation of the Dutch provinces assembled in 1579; and another where many of the preliminaries of the peace of 1713 between the allies and the French were agreed to. The university is a plain building, but contains a valuable library of 50,000 volumes, a museum, an anatomical hall, and a laboratory, and has an observatory and botanic garden. It was founded in 1636, has 22 professors, and in 1858-'9 had 469 students. There are numerous schools. The manufactures include cotton, linen, silk, woollen cloth, carpets, plush or "Utrecht velvet," leather, &c.

UVALDE, a new S. W. co. of Texas, bounded W. by the Nueces river, and drained by the Rio Frio and its affluents; area, 1,480 sq. m.; pop. in 1860, 506, of whom 27 were slaves. About two thirds of the county is prairie land. The soil is very productive. Sheep and goats are raised extensively. Capital, Uvalde.

UVAROFF, SERGEI, a Russian statesman and author, born in St. Petersburg about 1798, died in 1855. He held various important offices under government, and became in 1818 president of the St. Petersburg academy of sciences, and subsequently curator of the university of the same city. He was created a count in 1836. He wrote in French an *Essai d'une académie Asiatique* (1810); *Essai sur les mystères d'Éléusis* (St. Petersburg, 1812); *De l'empereur Alex-*

andre et de Bonaparte (Brunswick, 1815); and *Esquisses politiques et littéraires* (Paris, 1843); and in German, "The Poet Nonnus of Panopolis" (1817); "Studies on the Ante-Homeric Era" (1821); and "Remarks upon Goethe" (1838).—His son ALEXEI published at St. Petersburg in 1852 a volume of travels along the N. shore of the Black sea.

UVULA, the conical fleshy appendage, hanging down toward the tongue from the border of the soft palate, on the median line. It is made up of muscular substance, covered by mucous membrane; from it arise on each side two folds, called the pillars of the fauces, between which, on the back part and sides of the throat, are the tonsils. It varies in size and length in different individuals, but is generally $\frac{1}{2}$ to $\frac{3}{4}$ of an inch long; it is sometimes so long as to rest upon the tongue, causing harassing cough from its continued tickling, requiring the use of astringent gargles or even a partial excision; it is occasionally bifid at the tip.

UWINS, THOMAS, an English painter, born in London in 1783, died Aug. 25, 1857. In early life he was much employed in designing for illustrated works, and making water color copies of paintings for the use of engravers; but subsequent to 1826, when he visited southern Europe for the benefit of his health, he painted a numerous and popular series of pictures illustrating the social life of the Italian peasantry. He also painted English and French peasant pieces, and somewhat later illustrations from popular authors and from sacred and profane history. His historical pictures are his least successful productions. In 1836 he was elected a royal academician; and for several years he was keeper of her majesty's pictures and of the national gallery.

UZZIAH, or AZARIAH, a king of Judah. See HEBREWS, vol. ix. pp. 84, 85.
